HAN_UNIVERSITY
OF APPLIED SCIENCES

1 Exam Regulations

These regulations stipulate the following:

1. The rules of conduct for students in written and digital exams and modular exams, insofar as these are not laid down in the Student Charter and the Education and Examination Regulations or related regulations.
2. The rules of conduct for students in review sessions and discussions of exams and modular exams, insofar as these are not laid down in the Student Charter and the Education and Examination Regulations or related regulations.

1 Code of Conduct for students during exams

The facilities provided by HAN for students with respect to exams and modular exams are laid down in the Student Charter and Education and Examination Regulations or related regulations. There is a code of conduct for students. In addition to general provisions, this code of conduct also contains provisions governing the conduct of students at exam venues. These exam regulations contain additional provisions regarding student behaviour during written and digital exams in particular.

Behaviour

The student:

1. follows the instructions given by the supervisor and treats him/her with respect;
2. behaves in such a way that he/she does not disturb other students at any time during the exam or when entering or leaving the exam venue. The student is must be silent before, during and after the exam when in and near the room where the exam is being held;
3. contacts the supervisor a.s.a.p. if anything is unclear before and/or during the exam.

Identification and admission

The student:

1. reports to the supervisor 15 minutes before the start of the exam at the exam room;
2. will only be admitted to the HAN exam if they can identify themselves with a valid student card or a valid proof of identity. This means:
   - a passport;
   - a European identity card;
   - a Dutch driving licence;
   - a European driving licence;
   - a Dutch residence permit.
3. if a student is sitting for a national exam they may only identify themselves with proof of identity;
4. must place his/her valid student card or other form of identification at the top right-hand corner of the desk during the exam so the supervisor can check his/her identity;
5. will have their name checked off the attendance list by the supervisor to confirm his/her participation in the exam;
6. must immediately inform the supervisor if they are not listed on the attendance list. That student will only be given the opportunity to participate in the exam if the course department or school has given prior approval for additions to the attendance list.

Theft/loss of identification

If the student is unable to show identification due to theft or loss, they can apply for a certificate of registration at the Exams Office, which will give them admission to the exam venue. This certificate will only be issued if the student can show the original police report and/or official request to the municipal authorities for new identity papers. The study needs to apply for the certificate well in advance of the exam.

Before the start of the exam

The student:

1. may only place items needed to complete an exam on/next to the table;
2. may not ±unless expressly stated otherwise ±have any of the following in their possession during the exam: digital data carriers or equipment with an integrated digital data carrier, such as USB flash drives, calculators, special watches, special glasses, special earphones, etc.;
3. may not wear a watch. A clock is provided in all exam venues;
4. may not ±unless expressly stated otherwise ±use the following resources during the exam: hard-copy versions of dictionaries, law books, textbooks, etc.; if these resources are permitted, they may be checked by the supervisors;
5. must put their coat, scarf, hat, bags, cases, mobile phone(s), smartphone(s), digital data carrier(s) and any equipment with an integrated digital data carrier(s) in the place specified by the supervisor;
6. must turn off mobile phones, smartphones, etc. before putting them away;
7. must write their name, student number, class/group and other details requested by the supervisor on all exam documents at the start of the exam. The student must also write his/her name on any note paper he/she uses;
8. will not have direct access to the exam venue after the actual start of the exam. Students who do not make it to the exam venue on time are still allowed to enter the exam venue 30 minutes after the actual start of the exam and are allowed to sit the exam for the remainder of the exam time. The supervisor makes a note of which students are late. Students strictly observe instructions given by the supervisors regarding where they are allowed to sit and they do not disturb students who have already started the exam.

During the exam

The student:

1. may not take toilet breaks during exam sessions of 120 minutes or less. During exams that last longer than 120 minutes, students may take a toilet break after 120 minutes if accompanied by a supervisor. Exceptions are possible for all exams in cases of physical discomfort, provided the supervisor is notified no later than 15 minutes before the start of the exam or immediately upon entry when arriving 30 minutes after the start of the exam;
2. may not leave or submit their work during the first 30 minutes of the actual start of an exam (to prevent disruption to other students and/or irregularities); If there are any students who enter the exam venue 30 minutes after the start, any students who want to

leave may only do so after the late students have started their exam;

3. will be given access to additional exam facilities if they are entitled to those facilities in accordance with a study contract or a decision to that effect by the board of examiners. These facilities apply if the student has registered for the exam well in advance;
4. may not consume any food during exams that last less than 150 minutes; students may consume food during exam sessions of 150 minutes or longer if this does not cause a nuisance to fellow students;
5. may only consume drinks from a resealable bottle/container;
6. must use the writing materials specified on the cover sheet (black or blue pen or lead pencil) to complete the exam;
7. must ensure that multiple-choice forms are filled in correctly and according to the instructions given by the supervisor;
8. may not copy an exam or parts thereof in any way or take the exam or its contents outside the exam venues in any manner.

Resources

The student:

1. may not use resources other than those permitted. The permitted resources will be announced in advance by the course department and will be listed on the exam cover sheet;
2. must ensure that resources do not have notes, etc. on them unless the exam cover sheet states that this is permitted.

Suspected irregularity

The student:

1. will be referred to Part 2 of the degree statute (the education and examination regulations), and Part 3, chapter 3, of the degree statute (the regulations of the board of examiners) for provisions concerning irregularities or fraud, penalties for irregularities or fraud and confiscation of evidence;
2. will be permitted by the supervisor to complete the exam in the event of a reasonable suspicion of an irregularity or fraud an G Z L O O V L J Q W K H µ) R U P I R U V X V S H L U U H J X O D U L W \ R U I U D X G ¶ I LW RO HF QI U EP \ W K H \ VKXDSYHU YLHVRQU L W

Handing in exam documents

The student:

1. checks before handing in the exam script and assignment(s) whether their name, student number, class/group number and any other details requested by the supervisor have been written correctly on all of the exam documents to be submitted;
2. submits all the exam documents including used and unused note paper to the supervisor and signs the attendance list for confirmation;
3. makes sure everything is left neat and tidy before leaving the exam venue.

2 Code of conduct for students during review/discussion sessions of assessed exam work

There is a code of conduct for students. In addition to general provisions, this code of conduct also contains provisions governing the conduct of students at exam venues.
Below are additional regulations regarding the review of assessed exam work, hereafter referred to DV µUHYLHZ¶

Before the review: Only students who have taken part in the exam for which the review is organised may be present in the classroom. A lecturer and a supervisor will be present during the review.

Behaviour

The student:

1. follows the instructions given by the supervisor and treats him/her with respect;
2. should behave in such a way that he/she does not disturb other students at any time during the review or when entering or leaving the room in which the review takes SODFH KHUHDIWHU UHIHUUHG WR DV WKH µURRP¶
3. must contact the supervisor a.s.a.p. if anything is unclear during the review.

Identification and admission

The student:

1. must show the supervisor a valid student card or another valid form of identification:
   - a passport;
   - a European identity card;
   - a Dutch driving licence;
   - a European driving licence;
   - a Dutch residence permit.

   If the student cannot show a student card or a valid form of identification, they will not be allowed to take part in the review/discussion.
   In the case of theft or loss of the identity document, the student can apply for a certificate of enrolment at the Exams Office, which will give them admittance to the room. This certificate will only be issued if the student can show the original police report and/or official request to the municipal authorities for new identity papers.
2. should have their name checked off the attendance list by the supervisor to confirm their participation in the review/discussion;
3. must place their valid student card or other form of identification at the top right-hand corner of the desk during the review/discussion so the supervisor can check their identity.

Start and resources

The student:

1. must ensure they have a copy of their answer sheet (yellow carbon copy) when reviewing a multiple-choice exam with OMR answer sheet;
2. may only place on the table the permitted resources that are listed on the review cover sheet or that are announced by the supervisor at the start of the review;
3. may not ±unless expressly stated otherwise ±have any of the following in his/her possession during the review: digital data carriers or equipment with an integrated digital data carrier, such

as mobile phone, smartphone, USB flash drive, calculator, special watch, special glasses, special earphones, etc.;

4. must put their coat, scarf, hat, bags, cases, mobile phone(s), smartphone(s), digital data carrier(s) and any equipment with an integrated digital data carrier(s) in the place specified by the supervisor;
5. must ensure their mobile phone(s), smartphone(s) or other digital data carrier(s) and any equipment with integrated digital data carrier(s) are switched off before putting them away;
6. must carefully complete all requested details on the protest form.

During the review/discussion

The student:

1. may not take a toilet break during the review;
2. may not eat anything during the review;
3. may only consume drinks from a resealable bottle/container;
4. may only place one or more of the following permitted documents on the table:
   a. assessment form
   b. yellow carbon copy (of the multiple-choice exam with OMR answer sheet)
   c. exam script
5. may not make any annotations or amendments to the completed exam script. If the student does this anyway, it is reported to the board of examiners as an irregularity.
6. may not copy or take with them any model answers or assignments. Neither may students copy their own exam scripts and/or those of other students.
7. may not copy an exam or parts of an exam in any way or take the exam or its contents outside the exam venues by any other means.

Suspected irregularity

You can refer to the applicable provisions in Part 2 of the degree statute (the education and examination regulations) and Part 3, chapter 3, of the degree statute (the regulations of the board of examiners) for the applicable provisions concerning irregularities or fraud, sanctions for irregularities or fraud and confiscation of evidence.

Submitting reviewed (assessed) exam work

The student:

1. submits all the exam documents received for review to the supervisor and signs the attendance list to confirm this;
2. must make sure everything is left neat and tidy before leaving the room.

3 Final provisions

Unforeseen circumstances

In exceptional situations and cases not provided for by these regulations and in which an immediate decision is necessary, the decision will be taken by:

a. the head of the exams office (in so far as this is within the powers of the exams office);
b. the examiner (in so far this is within their powers);
c. the chair of the board of examiners (in so far as this is within their powers);
d. the supervisor, in consultation with the coordinating supervisor if it is not possible to wait until one of the above authorised people is present.

The interested parties will be informed of the decision as soon as possible.

Complaints and appeals concerning decisions and pro cedures of the exams office

For more on this, see these HAN regulations:

HAN_UNIVERSITY OF APPLIED SCIENCES

De surveillant grijpt in geval van een redelijk vermoeden van een onregelmatigheid of fraude direct in. Hij laat de student onder voorbehoud het tentamen afmaken en neemt alle bescheiden in waarmee de vermoedelijke onregelmatigheid/fraude heeft plaatsgevonden. De surveillant vult dit formulier in en levert dit met alle bescheiden na afloop van het tentamen direct in bij de coördinator-surveillant. De student ontvangt een kopie van het ingevulde formulier. Via het Tentamenbureau gaat het formulier vervolgens naar de examencommissie. De examencommissie neemt contact op met de student.

The supervisor intervenes immediately in case of a suspected irregularity or fraud. He or she provisionally allows the student to finish the exam, and seizes all documents that he or she suspects are involved in the suspected irregularity/fraud. The supervisor fills in this form and submits it to the coordinating supervisor along with all accompanying items immediately after the exam. The student in question receives a copy of the completed form. The form is then sent to the Board of Examiners via the exams office. The Board of Examiners will contact the student.

1.1. Outline of the curriculum

T Z ‰ Œ } (• •] } v o u • š offered as a full-time and a part-time degree course and covers 90 EC. 60 credits for the teaching phase, 30 of which are targeted at the study track, and 30 credits of the program are offered to all students jointly and 30 EC for the major project.
The full-time programme takes approximately 18 months, including the major project, based on a weekly study load of 40 hours and a break during the summer. Part-time takes approximately t years, based on a weekly study load of 20 hours, including the major project. The degree is divided in modules of 15 EC.

The D • š Œ [• P Œ Engineering Systems offers 2 compulsory modules:

- Applied Control and
- Systems Modelling

We offer you the following elective modules grouped by tracks:

Tracks	Elective modules
AS Automotive Systems:	Advanced Vehicle Dynamics Advanced Controller Design Hydrogen technology Innovations in Powertrains Sustainable Fuel Engines and Emissions Smart Infrastructure Smart Vehicles
CES Control & Embedded Systems	Advanced Controller Design Big Data & Small Data Distributed Systems
SE Sustainable Energy	Hydrogen Technology Smart Power Supply Sustainable Energy Systems (mandatory for SE
	Theoretical part of Big Data & Small Data : can followed by students AS and SE during the electives or together with the major project.

1.2. Competences / final qualifications and the Dublin descriptors

The competences (final qualifications) for the Master are defined as follows:

	Final qualification	Description
C1	Analysing and defining problems	To be able to critically analyse the engineering problem through active communication with the problem owner, to translate this a problem formulation, feasible solution approaches and scientifically valid conclusions and recommendations, to be communicated again to the problem owner.
C2	Design	To be able to systematically translate the engineering problem model at an abstract level, (i.e. reducing it to its essentials in te of model and problem requirements) and to validate results against the real life situation and problem formulation.
C3	Testing	To be able to systematically translate the engineering problem concrete level, and to validate results against the real life situat and problem formulation.
C4	Managing work processes:	To be able to put engineering activities within the perspective o engineering company processes, including quality control principles. To be able to incorporate the economical (cost) and societal (safety, sustainability) consequences in the design or development process.
C5	Conducting research	To have gained specialized scientific knowledge and skills in th field of engineering.
C6	Communication and collaboration	To be able to work on a problem within a multidisciplinary conte in an industrial environment. To be able to work on a problem i an international engineering context in an industrial environmer
C7	Professional developmer	To be able, through self Œ (o š] } v U š }] u ‰ Œ } À } professional acting

And the following Dublin descriptors:

	Dublin descriptor	Description
DD1	Knowledge and understanding	Provides a basis or opportunity for originality in developing or applying ideas often in a research context.
DD2	Applying knowledge an understanding	Through problem solving abilities applied in new or unfamiliar environments within broader (or multidisciplinary) context.
DD3	Making judgements	Demonstrates the ability to integrate knowledge and handle complexity, and formulate judgements with incomplete data.
DD4	Communication	Of their conclusions and underpinning knowledge and rationale (restricted scope) to specialist and non-specialist audiences (monologue).
DD5	Learning skills	Study in a manner that may be largely self-directed or autonomous.

The modules (mentioned on page 3) consists of a number of units of study. All these study units relate to the qualifications (page 4) we intend to teach you. The description relates the content of individual study unit to the qualifications, through the test criteria of the assessment of the study unit. These test criteria are included in the description as the learning outcomes. This relation between the criteria study unit, the qualifications and the Dublin descriptors are summarized in Assessment why and how. As all modules together cover all qualifications, a completion of the modules with sufficient mark entitles you to receive the degree Master of Science (MSc.).

1.3. Modules and the units of study

Below you find a schematic overview that gives you an overall impression of the degree program. It also describes the elective units in the degree program.

Units of study: mandatory (60 EC)

M SM	Module Systems Modelling			
Teaching Term	Semester 1			
Overview units of study	Units of Study		EC	study load
	M SM AP	Applied Physics	2.0	56
	M SM IM	Introduction Modelling	2.0	56
	M SM PMS	Practice Modelling and Simulation	2.0	56
	M SM EBM	Energy Based Modelling	2.0	56
	M SM SI	System Identification	2.0	56
	M SM MP	Systems Modelling Minor Project including Research Sk	5.0	140
			15	420

M AC	Module Applied Control			
Teaching Term	Semester 1 / Semester 2			
Overview units of study	Units of Study		EC	study load
	M AC FC	Feedback Control	4.0	112
	M AC ACS	Apply Control Strategy	2.0	56
	M AC CI	Controller Implementation	2.0	56
	M AC MSO	Multivariable systems and optimizations	2.0	56
	M CD MP	Applied Control Minor Project	5.0	140
			15	420

M MAJP	Module Major Project			
Teaching Term	Semester 1 / Semester 2			
Overview units of study	Units of Study		EC	study load
	M MAJP MP	Major Project	28	784
	M MAJP MWP	Managing Work Processes	2	56
			30	840

Modules and units of study: electives

Track Automotive:

a. Advanced Vehicle Dynamics & Control

M AVD	Module Advanced Vehicle Dynamics			
Teaching Term	Semester 1 / Semester 2			
Overview units of study	Units of Study /		EC	study load
	M AVD T	Advanced Vehicle Dynamics Theory	7.5	210
	M AVD CS	Advance Vehicle Dynamics Capita Selecta	2.5	70
	M AVD MP	Advanced Vehicle Dynamics Minor Project	5.0	140
			15	420

M ACD	Module Advanced Controller Design			
Teaching Term	Semester 2

Module code AEA MES M AC	Applied Control
Degree program	Master Engineering Systems
Target Group	All students, mandatory
Coordinating Lecturer	Richard Kaandorp
Registering for educational components	In case of first semester: week 0 Week 2.3 / 2.4 in case of joining the module in semester 2 Week 4.3 / 4.4 in case of joining the module in semester 1
Professional Task	Design and test a controller
Professional Products	Models
Credits / Study load	15 EC / 420 hours
Relationship with and entry requirements concerning examinations	Simultaneously to the Module Systems Modelling or (for part time students) after taking classes Systems Modelling
General Description	In this module the student will gain knowledge on designing a PID, lag-lead or digital controller. Furthermore, the usefulness a specific control strategy will be discussed using different papers. This strategy can solve problems that can occur wher using the classical control theory. Finally, when having various options for defining a controller, an optimal path would be helpful. This can reduce cost for example and makes it neces to define an objective function. The theory learned will be implemented in a platform and run a practical setup. The student learns to design a controller for a practical setup the following design steps and tasks: x Creating a feedback controller x Analysing an uncontrolled system x Applying an advanced control strategy x Applying a controlled system
Final Qualifications	C1 Analysing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration C7 Professional development
Units of study	Feedback Control (4 EC) Apply Control Strategy (2 EC) Controller Implementation (2 EC) Multivariable systems and optimizations (2 EC) Applied Control Project (5 EC)

Unit of Study (UoS) AEA MES M AC FC	Feedback Control
General Information	
Long name of unit of study	Feedback Control
Short name of unit of study	Feedback Control
Alluris unit of study name	Feedback Control
Code for unit of study OSIRIS	AEA MES M AC FC
Alluris unit of study code	M AC FC
Teaching Term	Semester 1 Semester 2
Registering for educational components	For all education offered after 31 January 2023, you need to register for the educational components you wish to follow. Se W Œ š ï Z K ^ / Z / ^ Z P µ o š] } v • (} Œ µ š Æ u • [(} Œ u } Œ] v (} Œ u š] } v X
Credits/study load	4 EC / 112 hours
Study hours (contact hours)	38 contact hours + 3 contact hours exam
Entry requirements	It is expected that the student has mastered basic mathematic skills specifically 1st and 2nd order differential equations, matrix calculations and calculations with complex numbers.
Content and organization	
General description	In this course students will learn how to design a PID, lag-lead digital controller. A variety of processes is used to illustrate th design procedure. The controllers will be presented in functional block diagrams and within the time, Laplace and frequency domain. Specific techniques are used, such as notch filtering, wind-up preventi and Smith predictor. Also, a digital controller will be designed.
Required literature / • Œ] ‰ š] } v } (Z o u š Œ] o [	Nise N.S., Control Systems Engineering, John Wiley & Sons Handouts Specific articles about control structures

Activities and/or instructional formats	Self-study, Working on assignments and exercises, Modelling with Matlab-Simulink

	Work Forms: Lectures, review exercises, discussion
Examinations	
Final Qualifications	C1 Analysing and defining problems C2 Design of controllers
Assessment dimensions / learning outcomes	Dimensions of assessment: - Knowledge and understanding (analysing and defini problems, design of controllers) - Applying knowledge and understanding (design of controllers) - Making judgements (design of controllers) The student can analyse the physical system (first and secon order, higher order) and/or a model (linear/ nonlinear, SISO/MIMO). The student can apply techniques such as Pole/zero-plot and step/ramp responses in order to determine the requirements the controlled system. The student can agree on specifications (stability, offset, settli time, overshoot, phase and gain margin) of the controller with the client. The student can apply techniques such as Bode plots (open l closed loop) and Nyquist diagrams in order to determine the requirements of the controlled system. The student can model components in the digital control loop and make use of sampling and conversions to agree on specifications of the controller. (M AC FC HTE)
Assessment criteria	M AC FC WE assessment criteria: The student will be assessed on answering the questions: x clearly and to the point, including sufficient relevant explanation and depth, comparable with the depth of t literature studied x without irrelevant additional information x using correct equations and models for the situation (f example when to use linear or nonlinear models) x using correct units for quantities in equations, graph labels, etc. M AC FC HTE assessment criteria: The student will be assessed on the criteria mentioned on the evaluation form. (next page)

Content and organization	
General description	This course covers the essential concepts of linear systems a control methodologies based on state-space models with (possibly) multiple inputs and multiple outputs. First, several structural properties are considered, such as input-output stability, internal stability, controllability and observability. Secondly, feedback strategies based on the state and the out are studied, and includes the notions of stabilizability and detectability, as well as the design of state observers and dynamic compensators. In the last part of the course, the theo of linear quadratic regulators (LQR) and the application of cos functions is introduced to optimally tune the feedback controllers. Computations, analysis and control designs will be mainly performed usingD š o – • ^ } v š Œ } o ^ Ç • š u • d } to real-life systems. Credits/study load	5 EC / 140 hours
Study hours (contact hours)	28 contact hours and 4 contact hours presentation
Entry requirements	Simultaneously to the Module Systems Modelling or after taking classes Systems Modelling
Content and organization	
Professional task	Development of a controller
(Professional) products	Controller implementation, documentation/presentation
General description	The Project serves to challenge the students to apply their knowledge and skills on a real-life problem, in correspondence w a subset of the final qualifications. The project covers the followi topics: x The problem to be solved requires an understanding and active analysis of distinctive disciplines. x The project will always include the step from a real-life problem to a more abstract representation of the problem x physical system: PN-plot, bode, step responses, linear/nonlinear; Control goals; Requirements: Stability, Offset, Settling time, Overshoot, Phase and gain margin; SISO/MIMO; system engineering x Controller design: [analog] PID, lead, lag, anti-windup, smith predictor, bumpless transfer. [digital] Euler/Tustin, zoh, sampling, PWM, bang-bang.

	The problem analysis will result in a problem solution to be translated in such terms that conclusions can be drawn based or extent the problem has been solved and objectives fulfilled. Part of the project is the peer review: In a peer review session th contribution of the group members to the project is determined b the group members themselves. The focus is on content and collaboration. Ideally the supervisor (tutor) is also present, but th is not strictly necessary. Students should be aware of their own functioning within the project group, so should arrange peer feedback within their project group regularly (at least twice during the project).

Examinations	
Final Qualifications	C1Analysing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration C7 Professional development
Assessment dimensions / learning outcomes	Dimensions of assessment: - Applying knowledge and understanding (analysing and defining problems, design of controllers, testing of controlled systems, conducting research) - Making judgements (analysing and defining problems, design of controllers, testing of controlled systems, conducting research) - Communication (managing work processes, communica and collaboration)

	- Learning skills (professional development) Learning outcomes: The student presents a clear justification of the project approach The student plans effectively. The student carries out a project based on a real-life problem in which model development and analysis as well as experimental validation are essential parts by applying knowledge and understanding and making judgements based on analysis and validation techniques. The student structures the working process in the engineering domain and is able to effectively communicate the core findings i structured and convincing way. The student is able to systematically search for information, such e.g. models, and judge its relevance. The student communicates the project findings in a clear and structured manner with colleague, customers and the wider publi in oral and written forms. The content has been reviewed by pee and/or supervisor. The student reflects on his/her role in the project and on his/her professional development. The student can design and create an analog and/or digital feedback controller for linear physical system choosing appropria techniques (applying anti-windup and bumpless transfer scheme selecting resolution and sample rate).
Assessment criteria	The student will be assessed on the criteria mentioned on the evaluation forms. The result of the MP is determined by 3 exams 1. Project Plan: For the Project Plan a pass or no pass will be defined by the examiner. The project plan has to be sufficient before starting the execution of the project. 2. Group Contribution: For the contribution of the individual student to the group a pass no pass will be defined by the examiners. The examiners can us outcome of the peer review, but also can deviate from it. 3. Report and Presentation: For the Report and Presentation a group mark will be given by th examiners. The individual student mark is equal to the group ma ‰ Œ } À] š Z š šZGroup pšQontribution is sufficient (pass). the Group Contribution of the student is insufficient, no mark will given and the student is unable to finish the minor project.

Module code AEA MES M SM	Systems Modelling
Degree program	Master Engineering Systems
Target Group	All students, mandatory
Coordinating lecturer	Frank Poelmans
Registering for educational components	In case of first semester education: week 0
Professional Task	Modelling Systems
Professional Products	Models
Credits / Study load	15 EC / 420 hours
Relationship with and entry requirements concerning examinations	First module after admission to the program (basic module)
General Description	In this module the student will gain knowledge on analysing physical systems in the mechanical, electrical and thermodynar fluid dynamic domains. Models for physical systems will be established by using white modelling and by using experimental data. Furthermore computer simulations of established models will b performed to analyse the systems behaviour. The models will be validated by collecting relevant datasets or designing a validation experiment. Finally the theory learned will be implemented in a modelling ca where the student also learns to evaluate relevant literature on modelling and learns to create a report and a presentation on t modelling-simulation-validation process.
Final Qualifications	C1 Analysing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration C7 Professional development
Units of study	Applied Physics (2 EC) Introduction Modelling (2 EC) Energy Based Modelling (2 EC) Practice Modelling and Simulation (2 EC) System Identification (2 EC) Systems Modelling Minor Project (5 EC)

Long name of unit of study	Introduction Modelling
Short name of unit of study	Introduction Modelling
Alluris unit of study name	Introduction Modelling
Code for unit of study OSIRIS	AEA MES M SM IM
Alluris unit of study code	M SM IM
Teaching Term	Term 1 Term 3
Registering for educational components	For all education offered after 31 January 2023, you need to register for the educational components you wish to follow. See W Œ š ï Z K ^ / Z / ^ Z P µ o š] } v • (} Œ µ š] Exau • [(} Œ u } Œ] v (} Œ u š] } v X
Credits/study load	2 EC / 56 hours
Study hours (contact hours)	16 contact hours + 3 contact hours exam
Entry requirements	It is expected that the student has mastered basic mathematics skills specifically Differential equations, Linear algebra, Laplace transforms and Complex numbers.
Content and organization	
General description	The course Introduction Modelling (IM) covers the following topics: x Modelling goals, process definitions, data flow diagram x 4+1 step approach x Model equations and mathematical solutions x Conversion of differential equations into transfer functio x Model simulation (Simulink, pole-zero map, step-respor bode plot) x Conversion of differential equations into state space models x Process delays, nonlinear systems x Introduction to multi domain systems
Required literature / • Œ] ‰ š] } v } (Z o u š Œ] o [	Erwin Kreyszig, Advanced Engineering Mathematics, 10th edition, International Student Version (2011) Norman S. Nise, Control Systems Engineering, 8th edition (EM edition), Wiley, ISBN 978-1-119-59013-2 Reader Introduction Dynamics, E. Tazelaar et al, HAN, 2016 Lecturing material available on Onderwijs Online

Recommended literature	-
Required software	Matlab, Simulink
Cohesion Relationship	Units of study Systems Modelling
Compulsory participation	No, but attendance will be registered
Activities and/or instructional formats	Self-study, Working on assignments, Simulation exercises, Cas studies Work Forms: Lectures
Examinations	
Final Qualifications	C1 Analysing and defining problems C2 Design
Assessment dimensions / Learning outcomes	Dimensions of assessment: - Knowledge and understanding (analysing and defining problems) - Applying knowledge and understanding (Design physica systems) The student is able to analyse moderately complex physical systems in the mechanical, electrical and/or thermodynamic/flu dynamic domains by describing the systems with either differer equations, transfer functions, state-space models or Bode diagrams in order to determine the system characteristics and b able to perform computer simulations. The student is able to describe the system using methods like white box modelling or step response experiments assuming lowest possible complexi for the analysis of relevant system characteristics.
Assessment criteria	The student will be assessed on answering the questions: x clearly and to the point, including sufficient relevant explanation and depth, comparable with the depth of the literature studied x without irrelevant additional information x using correct equations and models for the situation (for example when to use linear or nonlinear models) x using correct units for quantities in equations, graph labels, etc.

Recommended literature	-
Required software	Matlab, Simulink
Cohesion Relationship	Units of study Systems Modelling
Compulsory participation	No, but attendance will be registered
Activities and/or instructional formats	Home study, working on practical assignments

	Work forms: Lectures, interactive simulation exercises, assignments, reporting, presentations	
Examinations		
Final Qualifications	C2 Design C3 Testing	
Assessment dimensions / Learning outcomes	Dimensions of assessment: Applying knowledge and understanding (design, testing) The student is able to analyse, model, verify and validate a gi system (in terms of differential equations) which can be from different application fields (i.e. mechanical, electrical and thermodynamic/fluid dynamic) in modelling software(e.g. Matlab, Simulink or similar tools). The student is able to convert the system into different models i.e. state-space and transfer function models. The verification is performed with logical inputs along with log references. The validation is done by importing, filtering and comparing relevant datasets with the model data and/or by performing sensitivity analysis on the system parameters.	
Assessment criteria	The student will be assessed on the criteria (questions) mentioned on the evaluation form. (next page)

Credits/study load	5 EC / 140 hours
Study hours (contact hours)	28 contact hours and 4 contact hours presentation
Entry requirements	There are no further entry requirements after admission to the program.
Content and organization	
Professional task	Evaluate relevant literature and Analyse and validate the model
(Professional) products	Model Report (literature review) and presentation
General description	The students have to carry out an assignment, of which model development and analysis as well as experimental validation are essential parts. The Project serves to challenge the students to apply their knowledge and skills on a real-life problem, in correspondence w a subset of the final qualifications and the course discusses the s needed to perform a research project and includes performing a literature study. Part of the project is the peer review: In a peer review session th contribution of the group members to the project is determined b the group members themselves. The focus is on content and collaboration. Ideally the supervisor (tutor) is also present, but th is not strictly necessary. Students should be aware of their own functioning within the project group, so should arrange peer feedback within their project group regularly (at least twice during the project).
Required literature / • Œ] ‰ š] } v } (Z o u š Œ] o [	B. Hanington, B. Martin, Universal Methods of Design, Rockport Publishers Inc. 2012 Project Management, A Practical Approach, Roel Grit, Noordhoff Uitgevers, ISBN 9789001790929 Report Writing for readers with little time, Rien Elling, Bas Andew Noordhoff Uitgevers, ISBN 9789001812591

Activities and/or instructional formats	Research Work Forms: Lectures, Assignment
Examinations	
Final Qualifications	C1 Analysing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration C7 Professional development
Assessment dimensions / Learning outcomes	Dimensions of assessment - Knowledge and understanding (Conducting Research) - Applying knowledge and understanding (Analysing and defining problems, Design, Conducting Research) - Making judgements (Analysing and defining problems, Design, Conducting Research - Communication (Managing work processes, Communicat and Collaboration) - Learning skills (Professional development) Learning outcomes: The student presents a clear justification of the project approach The student plans effectively (M SM MP PP). The student carries out a project based on a real-life problem in which model development and analysis as well as experimental validation are essential parts by applying knowledge and understanding and making judgements based on analysis and validation techniques. The system descriptions are found via whi box modelling or step response experiments. The student structures the working process in the engineering domain and is able to effectively communicate the core findings i structured and convincing way. The student is able to systematically search for information, such e.g. models, and judge its relevance. The student communicates the project findings in a clear and structured manner with colleague, customers and the wider publi in oral and written forms. The content has been reviewed by pee and/or supervisor. The student reflects on his/her role in the project and on his/her professional development (M SM MP RP).

<table>
<tr><td>Assessment criteria</td><td colspan="4">The student will be assessed on the criteria mentioned on the evaluation forms. The result of the MP is determined by 3 exams
1. Project Plan:
For the Project Plan a pass or no pass will be defined by the examiner. The project plan has to be sufficient before starting the execution of the project.
2. Group Contribution:
For the contribution of the individual student to the group a pass no pass will be defined by the examiners. The examiners can us outcome of the peer review, but also can deviate from it.
3. Report and Presentation:
For the Report and Presentation a group mark will be given by th examiners. The individual student mark is equal to the group ma ‰ Œ } À] š Z š š Z • š µ v š [• ' Œ } µ ‰ } v š Œ the Group Contribution of the student is insufficient, no mark will given and the student is unable to finish the minor project.</td></tr>

Module code AEA MES M ACD	Advanced Controller Design
Degree program	Master Engineering Systems
Target Group	Elective module
Coordinating lecturer	Dimitri Jeltsema
Registering for educational components	Week 2.3/2.4 in case of joining the module in semester 2 Week 4.3/4.4 in case of joining the module in semester 1
Professional Task	Analyse, synthesize and apply advanced control methods
Professional Products	Models
Credits / Study load	15 EC / 420 hours
Relationship with and entry requirements concerning examinations	Applied Control Systems Modelling
General Description	This module deals with modelling, analysis and control of nonlinear, time-varying and uncertain systems. This module learns the student to: x distinguish between linear and nonlinear systems properties; x decide when to apply linear and when to apply nonlinea theory; x determine several stability properties for nonlinear systems; x apply energy-based concepts for stabilization; x determine controllability and observability properties for nonlinear systems; x design linearizing feedback transformations; x formulate and synthesize optimal control problems; x apply robust, adaptive and predictive control methods; work in both continuous and discrete time settings.
Final Qualifications	C1 Analysing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration C7 Professional development
Units of study	Advanced Controller Design Theory (7.5 EC) Advanced Control Design Capita Selecta (2.5 EC) Advanced Control project (5.0 EC)

Credits/study load	5.0 EC / 140 hours
Study hours (contact hours)	64 contact hours and 4 contact hours presentation
Entry requirements	Joined classes in Applied Control and Systems Modelling Successfully finished the exams of the minor projects Systems Modelling and Applied Control.
Content and organisation	
Professional task	Synthesis of a control system in incremental steps
(Professional) products	Controller implementation Project documentation, Presentation
General description	The project serves to challenge the students to apply their knowledge and skills on a real-life problem, in correspondence with a subset of the final qualifications. The problem to be solve requires application of advanced control theory to real-life problems. Part of the project is the peer review: In a peer review session contribution of the group members to the project is determined the group members themselves. The focus is on content and collaboration. Ideally the supervisor (tutor) is also present, but t is not strictly necessary. Students should be aware of their own functioning within the project group, so should arrange peer feedback within their project group regularly (at least twice duri the project).
Required literature / • Œ] ‰ š] } v } (Z o u š Œ] o [	Project Management, A Practical Approach, Roel Grit, Noordho Uitgevers, ISBN 9789001790929 Report Writing for readers with little time, Rien Elling, Bas Andeweg, Noordhoff Uitgevers, ISBN 9789001812591
Recommended literature	-
Required software	Matlab / Simulink. Students will build their own Arduino-based control system. Please reserve (approximately) 100 euro to ord the required components and materials.

Cohesion Relationship	Module Applied Control Module Systems Modelling Advanced Controller Design T and CS
Compulsory participation	Yes
Activities and/or instructional formats	Research Work Forms: Lab sessions and assignments Development of a control system.
Examinations	
Final Qualifications	C1 Analysing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration C7 Professional development
Assessment dimensions / Learning outcomes	Assessment dimensions: x Applying knowledge and understanding (analysing and defining problems, design, testing, conducting research) x Making judgements (analysing and defining problems, des testing, conducting research) x Communication (managing work processes, communicatio and collaboration) x Learning skills (professional development) Learning outcomes: The student presents a clear justification of the project approac The student plans effectively. The student carries out a project based on a real-life problem i which model development and analysis as well as experimenta validation are essential parts by applying knowledge and understanding and making judgements based on analysis and validation techniques. The student structures the working process in the engineering domain and is able to effectively communicate the core findings a structured and convincing way. The student is able to systematically search for information, su as e.g. models, and judge its relevance. The student communicates the project findings in a clear and structured manner with colleague, customers and the wider pub in oral and written forms. The content has been reviewed by pe and/or supervisor. The student reflects on his/her role in the project and on his/he professional development.

	The student evaluates, justifies and applies various linear and nonlinear analysis and control techniques for a given process.		
Assessment criteria	The student will be assessed on the criteria mentioned on the evaluation forms. The result of the MP is determined by 2 exams 1. Group Contribution: For the contribution of the individual student to the group a pas or no pass will be defined by the examiners. The examiners can use the outcome of the peer review, but als can deviate from it. 2. Report and Presentation: For the Report and Presentation a group mark will be given by the examiners. The individual student mark is equal to the P Œ } µ ‰ u Œ l ‰ Œ } À] š Z š š Z • š µ v š sufficient (pass). If the Group Contribution of the student is insufficient, no mark will be given and the student is unable to finish the minor project.

Registering for educational components	Week 2.3 / 2.4 in case of joining the module in semester 2 Week 4.3 / 4.4 in case of joining the module in semester 1
Professional Task	Collect dataset, interpret features of dataset and create prediction model
Professional Products	Models
Credits / Study load	15 EC / 420 hours
Relationship with and entry requirements concerning examinations	Module Systems Modelling
General Description	The module covers the following tasks: x Collect a relevant dataset x Interpret the features of the dataset x Offline create prediction model using either system identification techniques or supervised machine learni x Evaluate the model
Final Qualifications	C1 Analysing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration C7 Professional development
Units of study	Data Collection and machine learning (7,5 EC) Capita Selecta in Machine learning (2.5 EC) Project Big Data & Small Data (5 EC)

Unit of Study (UoS) AEA MES M BDSD T	Big Data and Small Data Theory
General Information	
Long name of unit of study	Big Data and Small Data Theory
Short name of unit of study	Big Data and Small Data T
Alluris unit of study name	Big Data and Small Data Theory
Code for unit of study OSIRIS	AEA MES M BDSD T
Alluris unit of study code	M BDSD T
Teaching Term	Semester 1 Semester 2
Registering for educational components	For all education offered after 31 January 2023, you need to register for the educational components you wish to follow. S W Œ š ï Z K ^ / Z / ^ Z P µ o š] } v • (} Œ µ Æ u • [(} Œ u } Œ] v (} Œ u š] } v X
Credits/study load	7.5 EC / 210 hours
Study hours (contact hours)	80 contact hours
Entry requirements	Joined classes in Systems Modelling and Applied Control
Content and organisation	
General description	The students have to carry out assignments in which they le how to clean up a dataset so that it is directly usable for prediction purposes. Furthermore students will analyse the data within the dataset and find e.g. correlation among variables. The student also learns how to make prediction models usin large number of supervised machine learning algorithms. Th student can apply these models to datasets and knows the advantages and disadvantages of the different methods.
Required literature / • Œ] ‰ š] } v } (Z o u š Œ] o [	Coursera course: Machine learning (Andrew NG)
Recommended literature	-
Required software	Matlab Simulink
Cohesion Relationship	Module Applied Control Module Systems Modelling Big Data and Small Data CS Big Data and Small Data MP
Compulsory participation	No, but attendance will be registered

Activities and/or instructional formats	Working on applied assignments using a simulation environment Work forms: Lectures, flipped classroom, assignments
Examinations	
Final Qualifications	C1 Analysing and defining problems C2 Design C3 Testing
Assessment dimensions / Learning outcomes	Dimensions of assessment: - Knowledge and understanding (Analysing and defini problems, design and testing algorithms) - Applying knowledge and understanding (design) - Making judgements (testing) The student formulates a question on what they want to achieve with the dataset (BDSD HTE1) The student judges if the dataset contains enough data and data contains the right features to answer the formulated question. He or she knows how to deal with missing or erroneous data and can scale that dataset if necessary and select test and validation sets (BDSD HTE1) The student interprets the features of the dataset. He or she able to use clustering techniques line K-means and look for correlation between data and use PCA (BDSD HTE1) The student can apply supervised machine learning techniq for predictive analysis like linear regression, logistic regressi and neural networks and motivate why they chose that particular technique. (BDSD HTE1) The student can evaluate and compare models by picking a relevant metric like e.g. R^2 (BDSD HTE1) The student can apply supervised machine learning techniq for predictive analysis like techniques from System Identification. (BDSD HTE2)
Assessment criteria	The student will be assessed on the criteria (questions) mentioned on the evaluation form. (next page)

Content and organisation	
Professional task	Create a predictive model
(Professional) products	A predictive model, Project documentation, Presentation
General description	The Project serves to challenge the students to apply their knowledge and skills on a real-life problem, in correspondenc with a subset of the final qualifications. The project covers the following topics: - Analysing data of a real life problem - Developing a prediction model for this problem. The problem analysis will result in a problem solution to be translated in such terms that conclusions can be drawn based the extent the problem has been solved and objectives fulfille Part of the project is the peer review: In a peer review sessio the contribution of the group members to the project is determined by the group members themselves. The focus is c content and collaboration. Ideally the supervisor (tutor) is also present, but that is not strictly necessary. Students should be

	aware of their own functioning within the project group, so should arrange peer feedback within their project group regula (at least twice during the project).

Examinations	
Final Qualifications	C1 Analysing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration C7 Professional development
Assessment dimensions / Learning outcomes	Dimensions of assessment: - Applying knowledge and understanding (analysing and defining problems, design, testing, conducting researc - Making judgements (analysing and defining problems, design, testing, conducting research) - Communication (managing work processes, communication and collaboration) - Learning skills (professional development) Learning outcomes: The student presents a clear justification of the project approa The student plans effectively.

	The student carries out a project based on a real-life problem which model development and analysis as well as experiment validation are essential parts by applying knowledge and understanding and making judgements based on analysis and validation techniques. The student structures the working process in the engineering domain and is able to effectively communicate the core findin in a structured and convincing way. The student is able to systematically search for information, s as e.g. models, and judge its relevance. The student communicates the project findings in a clear and structured manner with colleague, customers and the wider public in oral and written forms. The content has been reviewe by peers and/or supervisor. The student reflects on his/her role in the project and on his/h professional development. The student can make a motivated choice of which machine learning techniques he/she uses. The student can evaluate and compare models by picking a relevant metric like e.g. R^2
Assessment criteria	The student will be assessed on the criteria mentioned on the evaluation forms. The result of the minor project is determined by 2 exams 1. Group Contribution: For the contribution of the individual student to the group a pa or no pass will be defined by the examiners. The examiners c use the outcome of the peer review, but also can deviate from 2. Documentation and defence For the Report and Presentation a group mark will be given by the examiners. The individual student mark is equal to the P Œ } µ ‰ u Œ l ‰ Œ } À] š Z š š Z • š µ v š sufficient (pass). If the Group Contribution of the student is insufficient, no mark will be given and the student is unable to finish the minor project.

Module AEA MES M DS	Distributed Systems
Degree program	Master Engineering Systems
Target Group	Elective module
Coordinating lecturer	Aart-Jan de Graaf
Registering for educational components	Week 2.3 / 2.4 in case of joining the module in semester 2
Professional Task	Design, implement, verify, and test distributed embedded contr systems
Professional Products	Minor Project: Project plan, Report, Presentation Theory: Design Capita Selecta: Article
Credits / Study load	15 EC / 420 hours
Relationship with and entry requirements concerning examinations	x A basic level of programming experience, preferably in the programming language x Systems Modelling
General Description	The module provides an understanding of the principles on whi distributed embedded systems are based, such as architectura design, protocols, algorithms, fault handling, and maintenance. The key principle is real-time behaviour and how this affects quality requirements (resource limited reasoning). These principles are applied during a minor project that follows values and principles of agile software development and uses t programming language.
Final Qualifications	C1 Analysing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration C7 Professional development
Units of study	This module consists of the following 3 units: Distributed Systems Theory (7.5 EC) Distributed Systems Capita Selecta (2.5 EC) Distributed Systems Minor project (5.0 EC)

Unit of Study (UoS) AEA MES M DS T	Distributed Systems Theory
General Information	
Long name of unit of study	Distributed Systems Theory
Short name of unit of study	Distributed Systems T
Alluris unit of study name	Distributed Systems Theory
Code for unit of study OSIRIS	AEA MES M DS T
Alluris unit of study code	M DS T
Teaching Term	Semester 2
Registering for educational components	For all education offered after 31 January 2023, you need to register for the educational components you wish to follow. Se W Œ š ï Z K ^ / Z / ^ Z P µ o š] } v • (} Œ µ š] Æ u • [(} Œ u } Œ] v (} Œ u š] } v X
Credits/study load	7.5 EC / 210 hours
Study hours (contact hours)	64 contact hours + 3 contact hours exam
Entry requirements	Joined classes in Applied Control and Systems Modelling
Content and organization	
General description	The course provides the design concepts and principles of distributed embedded systems, such as architectural design, re time aspects, protocols, fault handling, and maintenance.
Required literature / • Œ] ‰ š] } v } (Z o u š Œ] o [	Kopetz, H. (2011). Real-time systems: design principles for distributed embedded applications. Springer Science & Business Media. Lecturing materials and hand-outs on OnderwijsOnline

Compulsory participation	Yes
Activities and/or instructional formats	Two students working together in a group, progress meetings with supervisor
Examinations	
Final Qualifications	C1 Analysing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration C7 Professional development
Assessment dimensions / learning outcomes	Dimensions of assessment: - Applying knowledge and understanding (analysing and defining problems, design, testing, conducting research principles of distributed systems in C) - Making judgements (analysing and defining problems, design, testing, conducting research of principles of distributed systems)) - Communication (managing work processes, communication and collaboration) - Learning skills (professional development) Learning outcomes (general): The student presents a clear justification of the project approac The student plans effectively. The student carries out a project based on a real-life problem ir which model development and analysis as well as experimenta validation are essential parts by applying knowledge and understanding and making judgements based on analysis and validation techniques.

	The student structures the working process in the engineering domain and is able to effectively communicate the core findings a structured and convincing way. The student is able to systematically search for information, suc as e.g. models, and judge its relevance. The student communicates the project findings in a clear and structured manner with colleague, customers and the wider pub in oral and written forms. The content has been reviewed by pe and/or supervisor. The student reflects on his/her role in the project and on his/her professional development. Learning outcomes (specific): The student applies the values and principles of agile software development. The student designs a distributed embedded system for a given problem description. The student justifies the real-time aspects of the designed distributed embedded system. The student implements the designed distributed embedded system by using the C programing language and selected hard platforms, tests the design, and demonstrates the realization. The student shows by means of test reports the fault tolerance capabilities of the implemented distributed system. The student reports realistically about efficiency, scalability, and maintenance of the implemented distributed system. The student uses a protocol standard, such as CANopen or Fle for transferring data between embedded systems.
Assessment criteria	The student will be assessed on the criteria mentioned on the evaluation forms. The result of the MP is determined by 3 exams 1. Project Plan: For the Project Plan a pass or no pass will be defined by the examiner. The project plan has to be sufficient before starting t execution of the project. 2. Group Contribution: For the contribution of the individual student to the group a pas or no pass will be defined by the examiners. The examiners ca the outcome of the peer review, but also can deviate from it. 3. Report and Presentation: For the Report and Presentation a group mark will be given by examiners. The individual student mark is equal to the group m ‰ Œ } À] š Z š š Z • š µ v š [• ' Œ } µ ‰ } v š If the Group Contribution of the student is insufficient, no mark will be given and the student is unable to finish the minor projec

Module AEA MES M HT	Hydrogen Technology
Degree program	Master Engineering Systems
Target Group	Elective module
Coordinating lecturer	Bram Veenhuizen
Registering for educational components	Week 2.3/2.4 in case of joining the module in semester 2 Week 4.4/4.4 in case of joining the module in semester 1
Professional Task	Understand, analyze and contribute to technical and societal aspects of hydrogen technology and the interactions.
Professional Products	Project plan (project) Report (project and capita selecta) Presentation (progress and final) Test plan and test report (project) if appropriate
Credits / Study load	15 EC / 420 hours
Relationship with and entry requirements concerning examinations	Applied Control Systems Modelling
General Description	The Module H2 focuses on the role hydrogen can play in the energy transition. We will mainly focus on decentralized system ranging from electrolysers and fuel cell stacks to internal combustion engines running on hydrogen. System design, integration and control will be important aspects, but also safety and other standards will be addressed. A separate course on s working with hydrogen is part of the module. Applications will range from static sustainable energy storage to mobile applicat in cars, trucks and inland shipping. All main design aspects will covered, mainly by using model based design techniques. The student will get familiar with analyzing and performing technical- and economical calculations on energy systems. Next to that the student will learn how to apply and understand relevant state-of-the art scientific literature. The students will wo in a project to apply the knowledge, application skills and insigh acquired during the lectures. The student will get the opportunit to perform lab experiments.
Final Qualifications	C1 Analyzing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration C7 Professional development
Units of study	Hydrogen Technology Theory (7.5 EC) Hydrogen Technology Capita Selecta (2.5 EC) Hydrogen Technology Project (5 EC)

Credits/study load	5 EC / 140 hours
Study hours (contact hours)	32 contact hours and 4 contact hours presentation
Entry requirements	Joined classes in Applied Control and Systems Modelling Successfully finished the exams of the minor projects Systems Modelling and Applied Control.
Content and organisation	
Professional task	The professional task consists of: - Design a hydrogen based Energy system, make a mod and simulate output - Perform tests on a hydrogen based energy system - Determine economic and social, legal viability and safety of hydrogen based energy system(s)
(Professional) products	Project plan, Report and Presentation/Defence
General description	The Project serves to challenge the students to apply their knowledge and skills on a real-life problem, in correspondence with a subset of the final qualifications. The project covers the following topics: x The problem to be solved requires an understanding a active analysis of distinctive disciplines. x The project will always include the step from a real-life problem to a more abstract representation of the problem. Required results are described under the professional product section. The problem analysis will result in a problem solution be translated in such terms that conclusions can be drawn bas on the extent the problem has been solved and objectives fulfil

	Part of the project is the peer review: In a peer review session contribution of the group members to the project is determined the group members themselves. The focus is on content and collaboration. Ideally the supervisor (tutor) is also present, but t is not strictly necessary. Students should be aware of their own functioning within the project group, so should arrange peer feedback within their project group regularly (at least twice duri the project).
Required literature / description of Z o Œ v] v P u š Œ] o [	Project Management, A Practical Approach, Roel Grit, Noordho Uitgevers, ISBN 9789001790929 Report Writing for readers with little time, Rien Elling, Bas Andeweg, Noordhoff Uitgevers, ISBN 9789001812591

Compulsory participation	Yes
Activities and/or instructional formats	Research Work Forms: Assignments, lectures
Examinations	
Final Qualifications	C1 Analysing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration C7 Professional development
Assessment dimensions / learning outcomes	Dimensions of assessment - Applying knowledge and understanding (Analysing and defining problems, Design, Conducting Research) - Making judgements (Analysing and defining problems, Design, Conducting Research - Communication (managing work processes, communication and collaboration) - Learning skills (professional development)

	Learning outcomes (general): The student presents a clear justification of the project approac The student plans effectively. The student carries out a project based on a real-life problem ir which model development and analysis as well as experimenta validation are essential parts by applying knowledge and understanding and making judgements based on analysis and validation techniques. The student structures the working process in the engineering domain and is able to effectively communicate the core findings a structured and convincing way. The student is able to systematically search for information, suc as e.g. models, and judge its relevance. The student communicates the project findings in a clear and structured manner with colleague, customers and the wider pub in oral and written forms. The content has been reviewed by pe and/or supervisor. The student reflects on his/her role in the project and on his/her professional development. Learning outcomes (specific): The student can critique on and analysis of problems in the fiel energy system design, system simulation and testing, feasibility study. The student evaluates energy models and make informed decisions based on scenario information. The student creates a proposal for improvement on an analyse and evaluated energy system or plan a new design for an ener system; taking into account use of renewable resources, energy efficiency and environmental sustainability.
Assessment criteria	The student will be assessed on the criteria mentioned on the evaluation forms. The result of the MP is determined by 3 exams 1. Project Plan: For the Project Plan a pass or no pass will be defined by the examiner. The project plan has to be sufficient before starting t execution of the project. 2. Group Contribution: For the contribution of the individual student to the group a pas or no pass will be defined by the examiners. The examiners ca the outcome of the peer review, but also can deviate from it. 3. Report and Presentation: For the Report and Presentation a group mark will be given by examiners. The individual student mark is equal to the group m ‰ Œ } À] š Z š š Z • š µ v š [• ' Œ } µ ‰ (pass) š

	If the Group Contribution of the student is insufficient, no mark will be given and the student is unable to finish the minor projec

Module AEA MES M IPT	Innovation in Powertrains
Degree program	Master Engineering Systems
Target Group	Elective module
Coordinating lecturer	Ad Oomen
Registering for educational components	Week 2.3 / 2.4 in case of joining the module in semester 2 Week 4.3 / 4.4 in case of joining the module in semester 1
Professional Task	Understand, analyse and contribute to innovations in electric hybrid and fuel cell powertrains
Professional Products	Minor Project: Project plan, Report, Presentation Theory: Model and report Capita Selecta: Presentation
Credits / Study load	15 EC / 420 hours
Relationship with and entry requirements concerning examinations	Applied Control Systems Modelling
General Description	In this module the student will gain knowledge on analysing innovative powertrains concerning performance, energy efficien environmental sustainability, costs or any other relevant aspect Theory:In the theory part the student will gain knowledge of the physics required for analysing powertrains. The working princip of the powertrain, its subsystems and components will be studi The student will model powertrains using grey box models. Attention will be paid to relevant control aspects of powertrains regarding optimization of energy efficiency in hybrid systems. T student will learn the physical implications of the concept choic made. Project:The student will implement the theory learned in a modelling project having the appropriate level of detail and showing the powertrain layout, relations between components and powertrain output. Validation will be done using experimen data.
Final Qualifications	C1 Analysing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration C7 Professional development
Units of study	This module consists of the following 3 units: Innovation in powertrains Theory (7.5 EC) Innovation in powertrains Capita Selecta (2.5 EC) Innovation in powertrains Minor Project (5 EC)

Unit of Study (UoS) AEA MES M IPT T	Innovation in Powertrains Theory

Credits/study load	7.5 EC / 210 hours
Study hours (contact hours)	64 contact hours + 6 contact hours exam (2 written exams)
Entry requirements	Joined classes in Applied Control and Systems Modelling
Content and organization	
General description	The course covers the following topics: x The vehicle powertrain as a system x Main powertrain functions x Powertrain subsystems and components x Powertrain modelling and model validation x Optimization of energy efficiency x Analysis on environmental sustainability x Control aspects of powertrains
Required literature / • Œ] ‰ š] } v } (Z o u š Œ] o [	x Mehrdad Ehsani, Yimin Gao, Ali Emadi, Modern Electric, Hybrid Electric, and Fuel Cell Vehicles, Third edition, ISBN 9781138330498 x Lecturing materials and hand-outs on OnderwijsOnline
Recommended literature	x Lino Guzzella, Antonio Sciarretta, Vehicle Propulsion systems, Third edition, Print ISBN 9783642359125 and online ISBN 9783642359132
Required software	MATLAB/Simulink, AME-sim Laptop with sufficient internal memory
Cohesion Relationship	Module Systems Modelling Module Applied Control Innovations in Powertrains CS Innovations in Powertrains MP

Compulsory participation	No, but attendance will be registered
Activities and/or instructional formats	Lectures, Self-study, Working on assignments
Examinations	
Final Qualifications	C1 Analysing and defining problems
Assessment dimensions / learning outcomes	Dimensions of assessment: - Knowledge and understanding (analysing and defining problems) The student analyses advanced and innovative configurations c complete vehicle powertrain and is able to make conceptual design choices concerning it. The student uses relevant white box or grey box modelling methods to determine the physical model of a vehicle powertra The student understands relevant control aspects of powertrain regarding optimization of energy efficiency. (WE1 and WE2) The student is able to analyse a problem in the field of automot powertrains by using state of the art Computer Aided Engineeri (CAE) tools. The student is able to create an optimized solution for an automotive powertrain. (HTE)
Assessment criteria	The student will be assessed on answering the questions: x clearly and to the point, including sufficient relevant explanation and depth, comparable with the depth of the literature studied x without irrelevant additional information x using correct equations and models for the situation (for example when to use linear or nonlinear models) x using correct units for quantities in equations, graph labels, etc. M IPT WE1 and WE2: The WarmUp Test result given by the le during the lecturing of the theory determines 20% of the score c the written (re-) exams. For re-exams the WarmUp Test result of the ‰ Œ À] } µ • š š u ‰ š v } o } v P Œ } µ v š • X [

Unit of Study (UoS) AEA MES M IPT CS	Innovation in Powertrains Capita Selecta
General Information	
Long name of unit of study	Innovations in Powertrains Capita Selecta
Short name of unit of study	Innovations in PowertrainsCS
Alluris unit of study name	Innovations in Powertrains Capita Selecta
Code for unit of study OSIRIS	AEA MES M IPT CS
Alluris unit of study code	M EHFP CS
Teaching Term	Semester 1 Semester 2
Registering for educational components	For all education offered after 31 January 2023, you need to register for the educational components you wish to follow. See W Œ š ï Z K ^ / Z / ^ Z P µ o š] } v • (} Œ µ š] Æ u • [(} Œ u } Œ] v (} Œ u š] } v X
Credits/study load	2,5 EC / 70 hours
Study hours (contact hours)	16 contact hours
Entry requirements	Joined classes in Applied Control and Systems Modelling
Content and organisation	
General description	Make a thorough comparative analysis of a peer reviewed scientific paper(s) on innovations in drive lines.
Required literature / • Œ] ‰ š] } v } (Z o u š Œ] o [	-
Recommended literature	-
Required software	-
Cohesion Relationship	Module Applied Control Module Systems Modelling Innovations in Powertrains T Innovations in Powertrains MP
Compulsory participation	Yes
Activities and/or instructional formats	Self-study, Instruction on demand, reporting, presenting
Examinations	
Final Qualifications	C5 Conducting Research

Assessment dimensions / Learning outcomes	Dimensions of assessment: - Knowledge and understanding (conducting research) - Making judgements (conducting research) - Communication (conducting research) The student is able to analyse a scientific paper on innovations powertrains and to identify its strengths and potential shortcomings. The student is able to formulate a proposal for extending or enhancing the analysed scientific research. The student understands the role of powertrain innovations and developments in the perspective of the modern, evolving societ	
Assessment criteria	The student will be assessed on the criteria (questions) mentio on the evaluation form.

Credits/study load	5 EC / 140 hours
Study hours (contact hours)	20 contact hours and 4 contact hours presentation
Entry requirements	Joined classes in Applied Control and Systems Modelling Successfully finished the exams of the minor projects Systems Modelling and Applied Control.
Content and organisation	
Professional task	Conducting literature research Modelling and validation
(Professional) products	Project plan Model Report Presentation
General description	The students have to carry out an assignment of which model development and analysis as well as experimental validation ar essential parts. The Project serves to challenge the students to apply their knowledge and skills on a real-life problem, in correspondence with a subset of the final qualifications and the course discusses the skills needed to perform a research proje and includes performing a literature study. Part of the project is the peer review: In a peer review session contribution of the group members to the project is determined the group members themselves. The focus is on content and collaboration. Ideally the supervisor (tutor) is also present, but t is not strictly necessary. Students should be aware of their own functioning within the project group, so should arrange peer feedback within their project group regularly (at least twice duri the project).
Required literature / • Œ] ‰ š] } v } (Z o u š Œ] o [	Project Management, A Practical Approach, Roel Grit, Noordhc Uitgevers, ISBN 9789001790929

Activities and/or instructional formats	Research Work Forms: Assignment
Examinations	
Final Qualifications	C1 Analysing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration C7 Professional development
Assessment dimensions/ learning outcomes	Dimensions of assessment - Applying knowledge and understanding (analysing and defining problems, design, conducting research) - Making judgements (analysing and defining problems, Design, Conducting Research - Communication (managing work processes, communication and collaboration) - Learning skills (professional development) Learning outcomes: The student presents a clear justification of the project approac The student plans effectively. The student carries out a project based on a real-life problem ir which model development and analysis as well as experimenta validation are essential parts by applying knowledge and understanding and making judgements based on analysis and validation techniques.

	The student structures the working process in the engineering domain and is able to effectively communicate the core findings a structured and convincing way. The student is able to systematically search for information, su as e.g. models, and judge its relevance. The student communicates the project findings in a clear and structured manner with colleague, customers and the wider pub in oral and written forms. The content has been reviewed by pe and/or supervisor. The student reflects on his/her role in the project and on his/he professional development. The student is able to analyse a real life problem concerning powertrains. The student is able to create a model for a powertrain problem and to perform a relevant analysis. The student is able to validate modelling results against the rea life situation and problem definition. The student is able to formulate a proposal for improvement of powertrain problem and is able to make an assessment of its viability taking into account energy efficiency and environmenta sustainability using proper techniques like prototyping, modellir or analysis.
Assessment criteria	The student will be assessed on the criteria mentioned on the evaluation forms. The result of the MP is determined by 3 exams 1. Project Plan: For the Project Plan a pass or no pass will be defined by the examiner. The project plan has to be sufficient before starting t execution of the project. 2. Group Contribution: For the contribution of the individual student to the group a pas or no pass will be defined by the examiners. The examiners ca the outcome of the peer review, but also can deviate from it. 3. Report and Presentation: For the Report and Presentation a group mark will be given by examiners. The individual student mark is equal to the group m ‰ Œ } À] š Z š š Z • š µ v š [• ' Œ } µ ‰ } v š If the Group Contribution of the student is insufficient, no mark will be given and the student is unable to finish the minor proje

Module AEA MES M PCD	Process Development
Degree program	Master Engineering Systems
Target Group	Elective module
Coordinating lecturer	Stef Tiggeloven
Registering for educational components	Not applicable
Professional Task	(Re)design and improve manufacturing processes
Professional Products	(Re)design and improvement of manufacturing processes
Credits / Study load	15 EC / 420 hours
Relationship with and entry requirements concerning examinations	Applied Control Systems Modelling
General Description	In this module students will learn and apply lean principles and methods for the design, operational control and improvement of manufacturing processes. The focus of the module is on the des and planning & control of manufacturing system. The use of new technology to support Lean Manufacturing plays an important rol in the module: as well new manufacturing as Industry 4.0 techn. Students will gain the knowledge and ability to apply importa Lean principles, methods and techniques, in combination new technologies, to (re-)design manufacturing processes. Discrete simulation, supporting the modelling and analysis of a system, is part of the course as well as the quality control methods. Next to this, students will gain knowledge on various top-down and botto up Continuous Improvement methods and tools (routines) to be applied in manufacturing companies. Students will apply this knowledge in an improvement project industry related projects where they use the (PDCA) A3 methodology and reporting method. This methodology consists o context analysis, describing the current state, formulating objectives, future state design, implementation planning and follo up design. Students will also learn to search for relevant scientifi literature which supports their improvement project. They will lea to link this literature to practice.
Final Qualifications	C1 Analysing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration C7 Professional development
Units of study	Process Development Operations Design (4 EC) Process Development Operations Planning and Control (3.5 EC) Process Development Capita Selecta (2.5 EC) Process Development Minor Project (5.0 EC)
