1 Description of the education

1.1. Outline of the curriculum

The professional master's program is offered as a full-time and a part-time degree course and covers 90 EC. 60 credits for the teaching phase, 30 of which are targeted at the study track, and 30 credits of the program are offered to all students jointly and 30 EC for the major project.
The full-time programme takes approximately 18 months, including the major project, based on a weekly study load of 40 hours and a break during the summer. Part-time takes approximately three years, based on a weekly study load of 20 hours, including the major project. The degree course is divided in modules of 15 EC.

The Master's Degree Program Engineering Systems offers 2 compulsory modules:

- Applied Control and
- Systems Modelling

We offer you the following elective modules grouped by tracks:

Tracks	Modules
Automotive Systems: Green mobility *Automotive Systems: Smart Mobility*	Advanced Vehicle Dynamics Electric, Hybrid & Fuel Cells Powertrains Hydrogen Technology Smart Infrastructure Smart Vehicles Sustainable Fuel Engines and Emissions
Control Systems	Big Data & Small Data Advanced Controller Design
Embedded Systems	Big Data & Small Data Distributed Systems
Lean Engineering	Process Development Product Development
Sustainable Energy	Big Data & Small Data Hydrogen Technology Smart Power Supply Sustainable Energy Systems

1.2. Competences / final qualifications and the Dublin descriptors

The competences (final qualifications) for the Master are defined as follows:

	Final qualification	Description
C1	*Analyzing and defining problems*	To be able to critically analyze the engineering problem through active communication with the problem owner, to translate this to a problem formulation, feasible solution approaches and scientifically valid conclusions and recommendations, to be communicated again to the problem owner.
C2	*Design*	To be able to systematically translate the engineering problem to a model at an abstract level, (i.e. reducing it to its essentials in terms of model and problem requirements) and to validate results against the real life situation and problem formulation.
C3	*Testing*	To be able to systematically translate the engineering problem to a concrete level, and to validate results against the real life situation and problem formulation.
C4	*Managing work processes:*	To be able to put engineering activities within the perspective of engineering company processes, including quality control principles. To be able to incorporate the economical (cost) and societal (safety, sustainability) consequences in the design or development process.
C5	*Conducting research*	To have gained specialized scientific knowledge and skills in the field of engineering.
C6	*Communication and collaboration*	To be able to work on a problem within a multidisciplinary context in an industrial environment. To be able to work on a problem in an international engineering context in an industrial environment
C7	*Professional development*	To be able, through self-reflection, to improve one's own professional acting

And the following Dublin descriptors:

	Dublin descriptor	Description
DD1	Knowledge and understanding	Provides a basis or opportunity for originality in developing or applying ideas often in a research context.
DD2	Applying knowledge and understanding	Through problem solving abilities applied in new or unfamiliar environments within broader (or multidisciplinary) context.
DD3	Making judgements	Demonstrates the ability to integrate knowledge and handle complexity, and formulate judgements with incomplete data.
DD4	Communication	Of their conclusions and underpinning knowledge and rationale (restricted scope) to specialist and non-specialist audiences (monologue).
DD5	Learning skills	Study in a manner that may be largely self-directed or autonomous.

The modules (mentioned on page 3) consists of a number of units of study. All these study units relate to the qualifications (page 4) we intend to teach you. The description relates the content of an individual study unit to the qualifications, through the test criteria of the assessment of the study unit. These test criteria are included in the description as the learning outcomes. This relation between the criteria per study unit, the qualifications and the Dublin descriptors are summarized in Assessment why and how. As all modules together cover all qualifications, a completion of the modules with a sufficient mark entitles you to receive the degree Master of Science (MSc.).

1.3. Modules and the units of study

Below you find a schematic overview that gives you an overall impression of the degree program. It also describes the elective units in the degree program.

Units of study: mandatory (60 EC)

M SM	Module Systems Modelling			
Teaching Term	Semester 1 / semester 2			
Overview units of study	Units of Study		EC	study load
	M SM AP	Applied Physics	2.0	56
	M SM IM	Introduction Modelling	2.0	56
	M SM PMS	Practice Modelling and Simulation	2.0	56
	M SM EBM	Energy Based Modelling	2.0	56
	M SM SI	System Identification	2.0	56
	M SM MP	Systems Modelling Minor Project including Research Skills	5.0	140
			15	420

M AC	Module Applied Control			
Teaching Term	Semester 1 / Semester 2			
Overview units of study	Units of Study		EC	study load
	M AC FC	Feedback Control	4.0	112
	M AC ACS	Apply Control Strategy	2.0	56
	M AC CI	Controller Implementation	2.0	56
	M AC MSO	Multivariable systems and optimizations	2.0	56
	M CD MP	Applied Control Minor Project	5.0	140
			15	420

M MAJP	Module Major Project			
Teaching Term	Semester 1 / Semester 2			
Overview units of study	Units of Study		EC	study load
	M MAJP MP	Major Project	28	784
	M MAJP MWP	Managing Work Processes	2	56
			30	840

Modules and units of study: electives

Track Automotive:

M AVD	Module Advanced Vehicle Dynamics			
Teaching Term	Semester 1 / Semester 2			
Overview units of study	Units of Study /		EC	study load
	M AVD T	Advanced Vehicle Dynamics Theory	7.5	210
	M AVD CS	Advance Vehicle Dynamics Capita Selecta	2.5	70
	M AVD MP	Advanced Vehicle Dynamics Minor Project	5.0	140
			15	420

M EHFP	Module Electric Hybrid & Fuel cells Powertrain			
Teaching Term	Semester 1 / Semester 2			
Overview units of study	Units of Study		EC	study load
	M EHFP T	Electric Hybrid & Fuel cells Powertrain Theory	7.5	210
	M EHFP CS	Electric Hybrid & Fuel cells Powertrain Capita Selecta	2.5	70
	M EHFP MP	Electric Hybrid & Fuel cells Powertrain Minor Project	5.0	140
			15	420

M HT2	Module Hydrogen Technology			
Teaching Term	Semester 2			
Overview units of study	Units of Study		EC	study load
	M HT T	Hydrogen Technology Theory	7.5	210
	M HT CS	Hydrogen Technology Capita Selecta	2.5	70
	M HT MP	Hydrogen Technology Minor Project	5.0	140
			15	420

M SI	Module Smart Infrastructure			
Teaching Term	Semester 2			
Overview units of study	Units of Study		EC	study load
	M SI T	Smart Infrastructure Theory	7.5	210
	M SI CS	Smart Infrastructure Capita Selecta	2.5	70
	M SI MP	Smart Infrastructure Minor Project	5.0	140
			15	420

M SV	Module Smart Vehicles			
Teaching Term	Semester 1 / Semester 2			
Overview units of study	Units of Study		EC	study load
	M SV T	Smart Vehicles Theory	7.5	210
	M SV CS	Smart Vehicles Capita Selecta	2.5	70
	M SV MP	Smart Vehicles Minor Project	5.0	140
			15	420

M SFEE	Module Sustainable Fuel, Engines and Emissions			
Teaching Term	Semester 2			
Overview units of study	Units of Study		EC	study load
	M SFEE T	Sustainable Fuel Engines and Emissions T	5.0	140
	M SFEE I	Sustainable Fuel Engines and Emissions CS	5.0	140
	M SFEE MP	Sustainable Fuel Engines and Emissions Minor Project	5.0	140
			15	420

Track Control Systems:

M ACD	Module Advanced Controller Design			
Teaching Term	Semester 2			
Overview units of study	Units of Study		EC	study load
	M ACD T	Advanced Controller Design Theory	7.5	210
	M ACD CS	Advanced Controller Design Capita Selecta	2.5	70
	M ACD MP	Advance Control Minor Project	5.0	140
			15	420

M BDSD	Module Big Data & Small Data			
Teaching Term	Semester 1 / Semester 2			
Overview units of study	Units of Study		EC	study load
	M BD DCML	Data Collection and machine learning	7.5	210
	M BD ASI	Apply Systems Identification (Capita Selecta)	2.5	70
	M BD MP	Big Data & Small Data Minor Project	5.0	140
			15	420

Track Embedded Systems:

M BDSD	Module Big Data & Small Data			
Teaching Term	Semester 1 / Semester 2			
Overview units of study	Units of Study		EC	study load
	M BD DCML	Data Collection and machine learning	7.5	210
	M BD ASI	Apply Systems Identification (Capita Selecta)	2.5	70
	M BD MP	Big Data & Small Data Minor Project	5.0	140
			15	420

M DS	Module Distributed Systems			
Teaching Term	Semester 2			
Overview units of study	Units of Study		EC	study load
	M DS T	Distributed Systems Theory	7.5	210
	M DS CS	Distributed Systems Capita Selecta	2.5	70
	M DS MP	Distributed Systems Minor Project	5.0	140
			15	420

Track Lean Engineering:

M PCD	Module Process Development			
Teaching Term	Semester 1			
Overview units of study	Units of Study		EC	study load
	M PCD OM	Process Development Operations Management	5.0	140
	M PCD FP	Process Development Factory Physics	2.5	70
	M PCD CS	Process Development Capita Selecta	2.5	70
	M PCD MP	Process Development Minor Project	5.0	140
			15	420

M PDD	Module Product Development			
Teaching Term	Semester 2			
Overview units of study	Units of Study		EC	study load
	M PDD MAP	Product Architecture Mapping	4.0	112
	M PDD PDD	Product Design and Development	3.5	98
	M PDD CS	Product Development Capita Selecta	2.5	70
	M PDD MP	Product Development Minor Project	5.0	140
			15	420

Track Sustainable Energy:

M BDSD	Module Big Data & Small Data			
Teaching Term	Semester 1 / Semester 2			
Overview units of study	Units of Study		EC	study load
	M BD DCML	Data Collection and machine learning	7.5	210
	M BD ASI	Apply Systems Identification (Capita Selecta)	2.5	70
	M BD MP	Big Data & Small Data Minor Project	5.0	140
			15	420

M HT2	Module Hydrogen Technology			
Teaching Term	Semester 2			
Overview units of study	Units of Study		EC	study load
	M HT T	Hydrogen Technology Theory	7.5	210
	M HT CS	Hydrogen Technology Capita Selecta	2.5	70
	M HT MP	Hydrogen Technology Minor Project	5.0	140
			15	420

M SPS	Module Smart Power Supplies			
Teaching Term	Semester 2			
Overview units of study	Units of Study		EC	study load
	M SPS EN	Energy Management	2.5	70
	M SPS PC	Power Control	2.5	70
	M SPS PQ	Power Quality	2.5	70
	M SPS AM	Asset Management	2.5	70
	M SPS MP	Smart Power Supplies Minor Project	5.0	140

2 Details of study: general modules

Module code **M AC**	**Applied Control**
Degree program	Master Engineering Systems
Target Group	All students, mandatory
Coordinating Lecturer	Richard Kaandorp
Professional Task	Design and test a controller
Professional Products	Models
Credits / Study load	15 EC / 420 hours
Relationship with and entry requirements concerning examinations	Simultaneously to the Module Systems Modelling or (for part time students) after taking classes Systems Modelling
General Description	In this module the student will gain knowledge on designing a PID, lag-lead or digital controller. Furthermore, the usefulness of a specific control strategy will be discussed using different papers. This strategy can solve problems that can occur when using the classical control theory. Finally, when having various options for defining a controller, an optimal path would be helpful. This can reduce cost for example and makes it necessary to define an objective function. The theory learned will be implemented in a platform and run on a practical setup. The student learns to design a controller for a practical setup in the following design steps and tasks: • Creating a feedback controller • Analyzing an uncontrolled system • Applying an advanced control strategy • Applying a controlled system
Final Qualifications	C1 Analyzing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration C7 Professional development
Units of study	Feedback Control (4 EC) Apply Control Strategy (2 EC) Controller Implementation (2 EC) Multivariable systems and optimizations (2 EC) Applied Control Project (5 EC)

Unit of Study (UoS) **M AC FC**	**Feedback Control**
General Information	
Name of unit of study	Feedback Control
Code for unit of study	M AC FC
Teaching Term	Semester 1 / Semester 2
Credits/study load	4 EC / 112 hours
Study hours (contact hours)	38 contact hours + 3 contact hours exam
Entry requirements	It is expected that the student has mastered basic mathematics skills specifically 1st and 2nd order differential equations, matrix calculations and calculations with complex numbers.
Objectives and instructional formats	
Professional task	Design feedback control
(Professional) products	Design of a classical controller with special add-ons in respect to given performance criteria
General description	In this course students will learn how to design a PID, lag-lead or digital controller. A variety of processes is used to illustrate the design procedure. The controllers will be presented in functional block diagrams and within the time, Laplace and frequency domain. Specific techniques are used, such as notch filtering, wind-up prevention and Smith predictor. Also, a digital controller will be designed.
Compulsory literature	Nise N.S., Control Systems Engineering, John Wiley & Sons Handouts Specific articles about control structures
Recommended literature	-
Required software	Matlab, Simulink
Relationship	Units of study: Applied Control Module: Systems Modelling
Compulsory participation	No, but attendance will be registered
Activities and instructional formats	Self-study, Working on assignments and exercises, Modelling with Matlab-Simulink Work Forms: Lectures, review exercises, discussion
Examinations	
Final Qualifications	C1 Analyzing and defining problems C2 Design of controllers
Assessment dimensions / learning outcomes	Dimensions of assessment: - Knowledge and understanding (analyzing and defining problems, design of controllers) - Applying knowledge and understanding (design of controllers) - Making judgements (design of controllers) The student can analyze the physical system (first and second order, higher order) and/or a model (linear/ nonlinear, SISO/MIMO).

	The student can apply techniques such as Pole/zero-plot and step/ramp responses in order to determine the requirements of the controlled system. The student can agree on specifications (stability, offset, settling time, overshoot, phase and gain margin) of the controller with the client. The student can apply techniques such as Bode plots (open loop, closed loop) and Nyquist diagrams in order to determine the requirements of the controlled system. The student can model components in the digital control loop and make use of sampling and conversions to agree on specifications of the controller. (M AC FC HTE)		
Assessment criteria	M AC FC WE assessment criteria: The student will be assessed on answering the questions: • clearly and to the point, including sufficient relevant explanation and depth, comparable with the depth of the literature studied • without irrelevant additional information • using correct equations and models for the situation (for example when to use linear or nonlinear models) • using correct units for quantities in equations, graph labels, etc. M AC FC HTE assessment criteria: The student will be assessed on the criteria mentioned on the evaluation form. (next page)

Feedback Control part 2: Digital Control

Evaluation and Awarding Marks
Name: ……
Student number: ……

	Mark	Motivation	Weight factor
Applying knowledge and understanding **C1 Analyzing en defining problems** **C2 Design** The student can apply the basics of discrete signal processing of linear time-invariant systems (z-transform, discrete transfer function, difference equation). The student can derive the frequency behavior of a discrete (control) system. The student can design a discrete control system using sampling principles, the theorem of Shannon and z-transform. The student can apply Tustin and Euler approximations. The methods and techniques are properly used. The student shows sufficient analytical skills to master the problem at hand.			1
Making judgments **C2 Design** The student can assess the stability and transient response behavior of discrete systems. The student is able to correctly interpret the quality of the results.			1

Unit of Study (UoS) **M AC ACS**	**Apply Control Strategies**
General Information	
Name of unit of study	Apply Control Strategies
Code for unit of study	M AC ACS
Teaching Term	Term 2 / term 4
Credits/study load	2 EC / 56 hours
Study hours (contact hours)	16 contact hours
Entry requirements	Simultaneously to the Module Systems Modelling or after taking classes Systems Modelling
Objectives and instructional formats	
Professional task	Apply control strategies
(Professional) products	Computer Simulations (case-studies) based on scientific research literature
General description	In this course students learn how to design specific structures in which there is interaction between control loops. The goal is to improve the transient response behavior. The control strategy (feedforward, cascade, compensation, override) is used for a limited amount of control goals. The students will work on a few case-studies that are based on scientific papers.
Compulsory literature	Handouts
Recommended literature	Scientific papers
Software and other materials	MATLAB/Simulink
Relationship	Units of study: Applied Control Module: Systems Modelling
Compulsory participation	No, but attendance will be registered
Activities and instructional formats	Self-study, warm-up tests, case studies Work forms: Lectures, interactive simulation exercises, assignments, reporting
Examinations	
Final Qualifications	C2 Design C5 Conducting Research
Assessment dimensions / learning outcomes	Dimensions of assessment: - Applying knowledge and understanding (design of controllers and testing of controlled systems) - Making judgements (testing controlled systems)

	The student can apply control strategies such as feedforward, cascade, compensation and override with use of frequency-response and root-locus techniques.	
Assessment criteria	M AC ACS HTE assessment criteria: The student will be assessed on the criteria (the questions) mentioned on the evaluation form (next page)

Unit of Study (UoS) **M AC CI**	**Controller Implementation (Capita Selecta)**
General Information	
Name of unit of study	Controller Implementation
Code for unit of study	M AC CI
Teaching Term	Semester 1 / semester 2
Credits/study load	2 EC / 56 hours
Study hours (contact hours)	16 contact hours
Entry requirements	Simultaneously to the Module Systems Modelling or after taking classes Systems Modelling
Objectives and instructional formats	
Professional task	Implement a controller
(Professional) products	Documentation
General description	In this course the implementation and evaluation of a controller on different platforms (SIL, PIL, HIL) or for an application in vehicle dynamics control is set up. It is important to structure the program to keep a good overview. Also, safety should be taken into account. The programs Labview and Matlab Simulink can be downloaded from internet. For PLC the Codesys software is provided. After a short introduction, a practical example is worked out and tested.
Compulsory literature	Lecturing material and hand-outs available on Onderwijs Online
Recommended literature	-
Software and other materials	Matlab, Simulink, Simmechanics, Labview, PLC, Hantune
Relationship	Units of study Systems Modelling Units of study Applied Control
Compulsory participation	yes
Activities and instructional formats	Home study, working on practical assignments Work forms: Lectures, interactive simulation exercises, assignments, reporting
Examinations	
Final Qualifications	C3 Testing controlled system
Assessment dimensions / learning outcomes	Dimensions of assessment: - Applying knowledge and understanding (testing of controlled systems) - Making judgements (testing of controlled systems) - Communication (testing)

	- Learning skills (testing The student can implement, test and evaluate a controller on an appropriate specific platform (e.g. SIL, PIL, HIL) for thermodynamic, hydraulic, mechanic processes or an application in vehicle dynamics and can check whether control specifications are met.	
Assessment criteria	M AC CI HTE assessment criteria: The student will be assessed on the criteria mentioned on the evaluation form (next page)

Controller Implementation (Capita Selecta)

Evaluation and Awarding Marks
Name, first name……
Student number …….
Topic……

	Mark	Motivation	Weight factor
Applying knowledge and understanding **C3: Testing** The student is able to identify the fields of application of different platforms using relevant literature. The student can demonstrate and explain how a controller can be implemented in each platform. The student can reflect on specific aspects, such as non-ideal sensors and actuators, signal conditioning, digitizing. The central questions have been answered. The methods and techniques properly used. The student shows sufficient analytical skills to master the problem at hand.			1
Making judgments **C3: Testing** The student is able to compare the different platforms on three key aspects. The student can determine the strengths and weaknesses of every platform. The student id able to correctly interpret and evaluate the quality of the results.			1
Communication **C3: Testing** The student reports in a way that the text is clearly understandable and in grammatically sound language.			1
Learning Skills **C3: Testing** The student displays discernible eagerness to tackle the task. The student shows problem solving skills. The student is self-reliant. The student reflects on the choices.			1

Unit of Study (UoS) **M AC MSO**	**Multivariable systems and optimization**
General Information	
Name of unit of study	Multivariable systems and optimization
Code for unit of study	M AC MSO
Teaching Term	Term 1 / term 3
Credits/study load	2 EC / 56 hours
Study hours (contact hours)	16 contact hours and 3 contact hours exam
Entry requirements	It is expected that the student has mastered basic mathematics skills specifically differential equations and matrix calculations.
Objectives and instructional formats	
Professional task	Controller optimization
(Professional) products	-
General description	This course covers the essential concepts of linear systems and control methodologies based on state-space models with (possibly) multiple inputs and multiple outputs. First, several structural properties are considered, such as input-output stability, internal stability, controllability and observability. Secondly, feedback strategies based on the state and the output are studied, and includes the notions of stabilizability and detectability, as well as the design of state observers and dynamic compensators. In the last part of the course, the theory of linear quadratic regulators (LQR) and the application of cost functions is introduced to optimally tune the feedback controllers. Computations, analysis and control designs will be mainly performed using Matlab's "Control Systems Toolbox" and applied to real-life systems. This course is complementary to the course "Feedback Control", i.e., state space models versus transfer function based analysis and design. Time-domain versus frequency domain approach. Together with the course "Feedback Control" this course will form the essential basis to enter the world of control systems engineering and beyond.
Compulsory literature	Nise N.S., Control Systems Engineering, John Wiley & Sons Handouts / Manuals
Recommended literature	
Software and other materials	MATLAB/Simulink

Unit of Study (UoS) **M AC MP**	**Applied Control Minor Project**
General Information	
Name of unit of study	Applied Control Minor Project
Code for unit of study	M AC MP
Teaching Term	Semester 1 / Semester 2
Credits/study load	5 EC / 140 hours
Study hours (contact hours)	28 contact hours and 4 contact hours presentation
Entry requirements	Simultaneously to the Module Systems Modelling or after taking classes Systems Modelling
Objectives and instructional formats	
Professional task	Development of a controller
(Professional) products	Controller implementation, documentation/presentation
General description	The Project serves to challenge the students to apply their knowledge and skills on a real-life problem, in correspondence with a subset of the final qualifications. The project covers the following topics: • The problem to be solved requires an understanding and active analysis of distinctive disciplines. • The project will always include the step from a real-life problem to a more abstract representation of the problem. • physical system: PN-plot, bode, step responses, linear/nonlinear; Control goals; Requirements: Stability, Offset, Settling time, Overshoot, Phase and gain margin; SISO/MIMO; system engineering • Controller design: [analog] PID, lead, lag, anti-windup, smith predictor, bumpless transfer. [digital] Euler/Tustin, zoh, sampling, PWM, bang-bang. The problem analysis will result in a problem solution to be translated in such terms that conclusions can be drawn based on the extent the problem has been solved and objectives fulfilled.
Compulsory literature	Project Management, A Practical Approach, Roel Grit, Noordhoff Uitgevers, ISBN 9789001790929 Report Writing for readers with little time, Rien Elling, Bas Andeweg, Noordhoff Uitgevers, ISBN 9789001812591
Recommended literature	-
Software and other materials	Matlab Simulink
Relationship	Units of study Applied Control

Activities and instructional formats	Research Work Forms: Lectures, Assignment
Examinations	
Final Qualifications	C1 Analyzing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration C7 Professional development
Assessment dimensions / learning outcomes	Dimensions of assessment: - Applying knowledge and understanding (analyzing and defining problems, design of controllers, testing of controlled systems, conducting research) - Making judgements (analyzing and defining problems, design of controllers, testing of controlled systems, conducting research) - Communication (managing work processes, communication and collaboration) - Learning skills (professional development) Learning outcomes: The student presents a clear justification of the project approach. The student plans effectively. The student carries out a project based on a real-life problem in which model development and analysis as well as experimental validation are essential parts by applying knowledge and understanding and making judgements based on analysis and validation techniques. The student structures the working process in the engineering domain and is able to effectively communicate the core findings in a structured and convincing way. The student is able to systematically search for information, such as e.g. models, and judge its relevance. The student communicates the project findings in a clear and structured manner with colleague, customers and the wider public in oral and written forms. The content has been reviewed by peers and/or supervisor. The student reflects on his/her role in the project and on his/her professional development. The student can design and create an analog and/or digital feedback controller for linear physical system choosing appropriate techniques (applying anti-windup and bumpless transfer schemes, selecting resolution and sample rate).

<table>
<tr><td>Assessment criteria</td><td colspan="3">The student will be assessed on the criteria mentioned on the evaluation form.

To determine the result of the minor project for each student:

1. A group mark will be defined by the examiners.
2. Peer review: each minor project group evaluates at least twice the contribution of the group members on content and collaboration. if the outcome of the first peer review is negative for the individual student, the student still has the opportunity to improve. If the result is negative again during the second peer review, the student will not receive a pass and therefore no final grade.
3. The individual mark is based on the group mark and the group contribution. The HAN supervisor can make use of the results of the peer review.

Students should be aware of their own functioning within the project group, so should arrange peer feedback within their project group regularly.</td></tr>

Project Applied Control: Project Documentation and Presentation
Evaluation and Awarding Marks

Name, first name……..
Student number: ……
Topic……..

	Mark	Motivation	Weight factor
Applying knowledge and understanding **C1: Analyzing and defining problems** **C2: Design** **C3: Testing** **C5: Conducting Research** The student is able to identify the process model and operating point based on white box or black box modelling, using relevant literature. The student is able to use appropriate control design techniques using Matlab-Simulink and create an analog and/or digital feedback controller for a linear physical system. The student uses relevant literature to design a controller. The student shows sufficient familiarity with current knowledge. The central questions have been answered. The methods and techniques are properly used. The student shows sufficient analytical skills to master the problem at hand.			1
Making judgments **C1: Analyzing and defining problems** **C2: Design** **C3: Testing** **C5: Conducting Research** The student is able to validate both process model and the behavior of the controlled process. The student has critical appraisal that has been successfully incorporated. The student is able to correctly interpret and evaluate the quality of the results.			1

Communication **C4: Managing work processes** **C6: Communication and Collaboration** The student can communicate his project findings and defend choices in a clear and structured manner in oral and written forms. The student is able to present the results to a problem owner. The student is able to work in a project team. The text is clearly understandable and in grammatically sound language. The formal requirements for literary sources have been met.			1
Learning Skills **C7: Professional development** The student is able to reflect on his role in the project and on his professional development. Does the student display discernible eagerness to tackle the task? The problem owner is involved adequately. The student shows problem solving skills. The student is self-reliant. The student reflects on the choices made.			1
Final Mark (group) **For a pass all marks should be sufficient**

Module code **M SM**	**Systems Modelling**
Degree program	Master Engineering Systems
Target Group	All students, mandatory
Coordinating lecturer	Frank Poelmans
Professional Task	Modelling Systems
Professional Products	Models
Credits / Study load	15 EC / 420 hours
Relationship with and entry requirements concerning examinations	First module after admission to the program (basic module)
General Description	In this module the student will gain knowledge on analyzing physical systems in the mechanical, electrical and thermodynamic/ fluid dynamic domains. Models for physical systems will be established by using white box modelling and by using experimental data. Furthermore computer simulations of established models will be performed to analyze the systems behavior. The models will be validated by collecting relevant datasets or designing a validation experiment. Finally the theory learned will be implemented in a modelling case where the student also learns to evaluate relevant literature on modelling and learns to create a report and a presentation on the modelling-simulation-validation process.
Final Qualifications	C1 Analyzing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration C7 Professional development
Units of study	Applied Physics (2 EC) Introduction Modelling (2 EC) Energy Based Modelling (2 EC) Practice Modelling and Simulation (2 EC) System Identification (2 EC) Modelling Systems Project (5 EC)

Unit of Study (UoS) **M SM AP**	**Applied Physics**
General Information	
Name of unit of study	Applied Physics
Code for unit of study	M SM AP
Teaching Term	Term 1 / term 3
Credits/study load	2 EC / 56 hours
Study hours (contact hours)	16 contact hours + 3 contact hours exam
Entry requirements	It is expected that the student has mastered basic mathematics skills specifically differential equations.
Objectives and instructional formats	
Professional task	Analyze physical systems
(Professional) products	-
General description	The course Applied Physics (AP) covers the following topics: Mechanical systems: • Dynamics and kinematics of general motion of a body (translations, rotations, moment of inertia, transmissions, energy conservation) • Vibrations with multiple DOF (free vibrations, excited vibrations) • 1st and 2nd order mechanical systems Electrical systems: • Electrical networks • Operational amplifier circuits • Electromechanical systems Thermodynamic/Fluid dynamic systems: • Energy balances, mass balances • Heat transfer, Bernoulli flow equation • 1^{st} law and 2^{nd} law of thermodynamics • Reversible changes of ideal gas, thermodynamic diagrams
Compulsory literature	• Erwin Kreyszig, *Advanced Engineering Mathematics,* 10^{th} edition, International Student Version (2011) • Engineering Mechanics: Dynamics SI Edition, R.C. Hibbeler, 14th Edition, Pearson, ISBN 9781292088723 • Norman S. Nise, Control Systems Engineering, 8th edition (EMEA edition), Wiley, ISBN 978-1-119-59013-2 • Reader Introduction Dynamics, E. Tazelaar et al, HAN, 2016 • Lecturing material available on Onderwijs Online
Recommended literature	• Transport Phenomena, The art of Balancing H. vd Akker, R.F. Mudde, Delft Academic Press, ISBN 9789065623584
Required software	-
Relationship	Units of study Systems Modelling

Compulsory participation	No, but attendance will be registered	
Activities and instructional formats	Self-study, Working on assignments and exercises Work Forms: Lectures	
Examinations		
Final Qualifications	C1 Analyzing and defining problems	
Assessment dimensions / learning outcomes	Dimensions of assessment: - Knowledge and understanding (analyzing and defining problems) The student is able to analyze moderately complex physical systems in the mechanical, electrical and/or thermodynamic/fluid dynamic domains by describing the systems with differential equations. The system descriptions are found via white box modeling.	
Assessment criteria	The student will be assessed on answering the questions: • clearly and to the point, including sufficient relevant explanation and depth, comparable with the depth of the literature studied • without irrelevant additional information • using correct equations and models for the situation (for example when to use linear or nonlinear models) • using correct units for quantities in equations, graph labels, etc.

Unit of Study (UoS) **M SM PMS**	**Practice Modelling and Simulation**
General Information	
Name of unit of study	Practice Modelling and Simulation
Code for unit of study	M SM PMS
Teaching Term	Term 1 / term 3
Credits/study load	2 EC / 56 hours
Study hours (contact hours)	16 contact hours
Entry requirements	There are no further entry requirements after admission
Objectives and instructional formats	
Professional task	Analyze physical systems
(Professional) products	Computer simulations and analysis
General description	PMS covers model assignments and simulations with Matlab-Simulink. • General software introduction in Matlab, Simulink • Simulation and analysis a system using different models (i.e. differential equations, state-space and transfer functions) • Analysis of basic cases (exercises at HAN, home taken, by each student separately) based on the domains treated in AP and IM (i.e. mechanical, electrical and thermodynamic/fluid dynamic) • Performing system verification and validation • Perform parametric analysis on systems for using loops. • Creating an efficient connection between scripting and Simulink modelling • Effectively plotting relevant data
Compulsory literature	Lecturing material and hand-outs available on Onderwijs Online
Recommended literature	-
Software and other materials	Matlab, Simulink
Relationship	Units of study Systems Modelling
Compulsory participation	No, but attendance will be registered
Activities and instructional formats	Home study, working on practical assignments Work forms: Lectures, interactive simulation exercises, assignments, reporting, presentations
Examinations	

Final Qualifications	C2 Design C3 Testing	
Assessment dimensions / Learning outcomes	Dimensions of assessment: Applying knowledge and understanding (design, testing) The student is able to analyze, model, verify and validate a given system (in terms of differential equations) which can be from different application fields (i.e. mechanical, electrical and thermodynamic/fluid dynamic) in modelling software *(e.g. Matlab, Simulink or similar tools).* The student is able to convert the system into different models i.e. state-space and transfer function models. The verification is performed with logical inputs along with logical references. The validation is done by importing, filtering and comparing relevant datasets with the model data and/or by performing sensitivity analysis on the system parameters.	
Assessment criteria	The student will be assessed on the criteria (questions) mentioned on the evaluation form. (next page)

Unit of Study (UoS) **M SM EBM**	**Energy Based Modelling**
General Information	
Name of unit of study	Energy based Modelling
Code for unit of study	M SM EBM
Teaching Term	Term 2 / term 4
Credits/study load	2 EC / 56 hours
Study hours (contact hours)	16 contact hours and 3 contact hours exam
Entry requirements	It is expected that the student has mastered basic mathematics skills specifically differential equations and matrix calculations.
Objectives and instructional formats	
Professional task	Analyze physical systems
(Professional) products	Models
General description	The course Energy Based Modelling (EBM) covers the following topics: • Introduction to Energy Based Modelling • Generalized variables and coordinate transformations • Energy and power functions • Euler-Lagrange equation • Hamilton's principle, Hamiltonian systems • Modelling complex systems in mechanical and electrical domain • Modelling multi-domain systems
Compulsory literature	Lecturing material and hand-outs, available on Onderwijs Online
Recommended literature	-
Software and other materials	-
Relationship	Units of study Systems Modelling
Compulsory participation	No, but attendance will be registered
Activities and instructional formats	Self-study, Working on assignments and exercises Work Forms: Lectures
Examinations	
Final Qualifications	C1 Analyzing and defining problems C2 Design C5 Conducting Research
Assessment dimensions / Learning outcomes	Dimensions of assessment: - Knowledge and understanding (analyzing and defining problems, conducting research) - Applying knowledge and understanding (design)

	The student is able to analyze complex mono-/multi-physical systems in the mechanical, electrical and/or thermodynamic/fluid dynamic domains by describing the systems with either differential and algebraic equations, transfer functions or state-space representations. The system descriptions are found via advanced white box modeling based on the internal energy of the system.	
Assessment criteria	The student will be assessed on answering the questions: • clearly and to the point, including sufficient relevant explanation and depth, comparable with the depth of the literature studied • without irrelevant additional information • using correct equations and models for the situation (for example when to use linear or nonlinear models) • using correct units for quantities in equations, graph labels, etc.

3 Elective Modules

Module code **M ACD**	**Advanced Controller Design**
Degree program	Master Engineering Systems
Target Group	Elective module
Coordinating lecturer	Dimitri Jeltsema
Professional Task	Analyze, synthesize and apply advanced control methods
Professional Products	Models
Credits / Study load	15 EC / 420 hours
Relationship with and entry requirements concerning examinations	Applied Control Systems Modelling
General Description	This module deals with modelling, analysis and control of nonlinear, time-varying and uncertain systems. This module learns the student to: • distinguish between linear and nonlinear systems properties; • decide when to apply linear and when to apply nonlinear theory; • determine several stability properties for nonlinear systems; • apply energy-based concepts for stabilization; • determine controllability and observability properties for nonlinear systems; • design linearizing feedback transformations; • formulate and synthesize optimal control problems; • apply robust, adaptive and predictive control methods; work in both continuous and discrete time settings.
Final Qualifications	C1 Analyzing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration C7 Professional development
Units of study	Advanced Controller Design Theory (7.5 EC) Advanced Control Design Capita Selecta (2.5 EC) Advanced Control project (5.0 EC)

Unit of Study (UoS) **M ACD T**	**Advanced Controller Design Theory**
General Information	
Name of unit of study	Advanced Controller Design Theory
Code for unit of study	M ACD T
Teaching Term	Semester 2
Credits/study load	7.5 EC / 210 hours
Study hours (contact hours)	64 contact hours
Entry requirements	Applied Control and Systems Modelling
Objectives and instructional formats	
Professional task	not applicable
(Professional) products	not applicable
General description	The student learns how to apply several linear and nonlinear analysis and control techniques to different nonlinear processes and simulate them using Matlab.
Compulsory literature	Lecturing material (readers, papers and handouts) will be made available on Onderwijs Online
Recommended literature	-
Required software	Matlab / Simulink
Relationship	Module Applied Control Module Systems Modelling
Compulsory participation	No, but attendance will be registered
Activities and instructional formats	Self-study, case-studies, working on practical assignments. Work forms: Lectures, interactive simulation exercises, assignments, reporting practical assignments.
Examinations	
Final Qualifications	C2 Design of controllers
Assessment dimensions / learning outcomes	Dimensions of assessment: - Knowledge and understanding (analysis) - Applying knowledge and understanding (design of controllers) The student is able to apply and evaluate various linear techniques applied to nonlinear systems. The student is able to carry out a basic analysis of nonlinear systems. The student is able to apply energy-based modelling and control to various real-life systems. M ACD T HTE1

	The student is able to apply adaptive, robust and optimal control techniques to linear and nonlinear systems. The student is able to carry out further analysis of nonlinear systems. (M ACD HTE2)		
Assessment criteria	The student will be assessed on the criteria (questions) mentioned on the evaluation form. (next page)

Unit of Study (UoS) **M ACD CS**	**Advanced Controller Design Capita Selecta**
General Information	
Name of unit of study	Advanced Controller Design Capita Selecta
Code for unit of study	M ACD CS
Teaching Term	Semester 2
Credits/study load	2.5 EC / 70 hours
Study hours (contact hours)	32 contact hours
Entry requirements	Applied Control and Systems Modelling
Objectives and instructional formats	
Professional task	Implement a controller
(Professional) products	Literature study report in the form of an article to inform pear students.
General description	Study various linear and nonlinear control techniques and apply two particular ones (student's own choice) to the experimental setup designed in the Minor Project.
Compulsory literature	To be decided during class, depending on the subject.
Recommended literature	To be decided during class, depending on the subject.
Software and other materials	-
Relationship	Units of study Advanced Controller Design
Compulsory participation	No, but attendance will be registered
Activities and instructional formats	Self-study, case studies Work forms: Lectures, interactive simulation exercises, assignments, reporting
Examinations	
Final Qualifications	C5 Conducting research
Assessment dimensions / Learning outcomes	Dimensions of assessment: - knowledge and understanding (conducting research and Professional Development) - Applying knowledge and understanding (conducting research) - Making judgements (conducting research) - Communication (conducting research) - Learning skills (conducting research)

	The student shows how to implement and evaluate control methodologies in a real-life environment.	
Assessment criteria	The student will be assessed on the criteria mentioned on the evaluation form.

Signature examiner :

Unit of Study (UoS) **M ACD MP**	**Advanced Controller Design Minor Project**
General Information	
Name of unit of study	Advanced Controller Design Minor Project
Code for unit of study	M ACD MP
Teaching Term	Semester 2
Credits/study load	5.0 EC / 140 hours
Study hours (contact hours)	64 contact hours and 4 contact hours presentation
Entry requirements	Applied Control and Systems Modelling
Objectives and instructional formats	
Professional task	Synthesis of a control system in incremental steps
(Professional) products	Controller implementation Project documentation, Presentation
General description	The project serves to challenge the students to apply their knowledge and skills on a real-life problem, in correspondence with a subset of the final qualifications. The problem to be solved requires application of advanced control theory to real-life problems.
Compulsory literature	• Project Management, A Practical Approach, Roel Grit, Noordhoff Uitgevers, ISBN 9789001790929 • Report Writing for readers with little time, Rien Elling, Bas Andeweg, Noordhoff Uitgevers, ISBN 9789001812591
Recommended literature	-
Software and other materials	Matlab / Simulink. Students will build their own Arduino-based control system. Please reserve (approximately) 100 euro to order the required components and materials.
Relationship	Module Systems Modelling Module Applied Control
Compulsory participation	yes
Activities and instructional formats	Research Work Forms: Lab sessions and assignments Development of a control system.
Examinations	
Final Qualifications	C1 Analyzing and defining problems C2 Design C3 Testing C4 Managing work processes

	C5 Conducting research C6 Communication and collaboration C7 Professional development
Assessment dimensions / Learning outcomes	Assessment dimensions: • Applying knowledge and understanding (analyzing and defining problems, design, testing, conducting research) • Making judgements (analyzing and defining problems, design, testing, conducting research) • Communication (managing work processes, communication and collaboration) • Learning skills (professional development) Learning outcomes: The student presents a clear justification of the project approach. The student plans effectively. The student carries out a project based on a real-life problem in which model development and analysis as well as experimental validation are essential parts by applying knowledge and understanding and making judgements based on analysis and validation techniques. The student structures the working process in the engineering domain and is able to effectively communicate the core findings in a structured and convincing way. The student is able to systematically search for information, such as e.g. models, and judge its relevance. The student communicates the project findings in a clear and structured manner with colleague, customers and the wider public in oral and written forms. The content has been reviewed by peers and/or supervisor. The student reflects on his/her role in the project and on his/her professional development. The student evaluates, justifies and applies various linear and nonlinear analysis and control techniques for a given process.
Assessment criteria	The student will be assessed on the criteria mentioned on the evaluation form. To determine the result of the minor project for each student: 1. **A group mark** will be defined by the examiners. 2. **Peer review**: each minor project group evaluates at least twice the contribution of the group members on content and collaboration. if the outcome of the first peer review is negative for the individual student, the student still has the opportunity to improve. If the result is negative again

<table>
<tr><td></td><td colspan="3">during the second peer review, the student will not receive a pass and therefore no final grade.
3. The individual mark is based on the group mark and the group contribution. The HAN supervisor can make use of the results of the peer review.

Students should be aware of their own functioning within the project group, so should arrange peer feedback within their project group regularly.</td></tr>

Advanced Controller Design: Project Documentation and Presentation, Evaluation and Awarding Marks

Name, first name……

Student number ……

	Mark	Motivation	Weight factor
Applying knowledge and understanding **C1: Analyzing and defining problems** **C2: Design** **C3: Testing** **C5: Conducting Research** Does the candidate show sufficient familiarity with current knowledge? Have the central questions been answered? Are the methods and techniques properly used? Does the student show sufficient analytical skills to master the problem at hand?			1
Making judgments **C1: Analyzing and defining problems** **C2: Design** **C3: Testing** **C5: Conducting Research** Has critical appraisal been successfully incorporated? Is the student able to correctly interpret and evaluate the quality?			1
Communication **C4: Managing work processes** **C6: Communication and Collaboration** Is the student able to present the results to a problem owner? Is the student able to work in a project team? Is the text clearly understandable and in grammatically sound language? Have the formal requirements for literary sources been met?			1
Learning Skills **C7: Professional development** Does the student display discernible eagerness to tackle the task? Is the problem owner involved adequately? Does the student show problem solving skills? Is the student self-reliant? Does the student reflect on the choices?			1
Final Mark (group) **For a pass all marks should be sufficient**			

Date : Signature examiner Signature examiner

Module code **M AVD**	**Advanced Vehicle Dynamics**
Degree program	Master Engineering Systems
Target Group	Elective module
Coordinating lecturer	Saskia Monsma
Professional Task	Model and validate linear and nonlinear vehicle dynamics
Professional Products	Project plan Report Model + data Presentation (progress and final)
Credits / Study load	15 EC / 420 hours
Relationship with and entry requirements concerning examinations	Systems Modelling and Applied Control
General Description	The module covers: modeling and validation of vehicle dynamics: linear and nonlinear, steady state and non-steady state, without and with (driver) control, emphasizing tires, driver, passenger cars, articulated vehicles and motorcycles.
Final Qualifications	C1 Analyzing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration C7 Professional development
Units of study	Advanced Vehicle Dynamics Theory 7.5 EC Advanced Vehicle Dynamics Capita Selecta 2.5 EC Advanced Vehicle Dynamics Minor Project 5.0 EC

Unit of Study (UoS) **M AVD T**	**Advanced Vehicle Dynamics Theory**
General Information	
Name of unit of study	Advanced Vehicle Dynamics Theory
Code for unit of study	M AVD T
Teaching Term	Semester 1 / Semester 2
Credits/study load	7.5 EC / 210 hours
Study hours (contact hours)	64 contact hours + 3 contact hours exam (written exam AVD1 and 20 minutes oral exam AVD2)
Entry requirements	Systems Modelling / Applied Control
Objectives and instructional formats	
Professional task	Model linear and nonlinear vehicle dynamics
(Professional) products	Not applicable
General description	The study unit covers modeling of vehicle dynamics: linear and nonlinear, steady state and non-steady state, without and with (driver) control, emphasizing tires, driver, passenger cars, articulated vehicles and motorcycles.
Compulsory literature	Alessandro Genta and Giancarlo Genta, Road Vehicle Dynamics, Fundamentals of Modeling and Simulation, 2016, World Scientific, ISBN 9814713430, 9789814713436 Lecturing material and hand-outs, available on OnderwijsOnline
Recommended literature	Joop P. Pauwelussen, Essentials of Vehicle Dynamics, 2014, Butterworth-Heinemann, ISBN: 9780081000366 R.J. Jagacinski, J.M. Flach.: *Control Theory for Humans*, ISBN nr. 0805822925 V. Cossalter.: *Motorcycle Dynamics,* 2nd edition (2006), ISBN nr. 978 – 1 – 4303 – 0861 – 4 P.Sweatman (ed.).: *PBS Explained, Performance Based Standards for Road Transport Vehicles*, report Australian Road Transport Suppliers Association (2003)
Required software	Matlab/Simulink
Relationship	Advanced Vehicle Dynamics: Capita Selecta and Minor Project

Compulsory participation	No, but attendance will be registered
Activities and instructional formats	Self-study, Working on assignments Work Forms: Lectures (flipped classroom)
Examinations	
Final Qualifications	C1 Analyzing and defining problems
Assessment dimensions / learning outcomes	Dimensions of assessment: • Knowledge and understanding (analyzing and defining problems) The student is able to analyze, synthesize and evaluate (AVD WE): • linear and nonlinear tire dynamics and models, including main influences like load transfer, combined slip, camber, suspension characteristic • steady state vehicle handling based on the single-track vehicle model including nonlinear tire models • vertical vehicle dynamics related to road input The student is able to analyze, synthesize and evaluate (AVD OE): • steady state and non-steady state dynamics of tires, passenger vehicles, articulated vehicles and motorcycles • closed-loop driver vehicle system dynamics and modeling with the preview driver model.
Assessment criteria	The student will be assessed (M AVD WE and M AVD OE) on answering the questions: • clearly and to the point, including sufficient relevant explanation and depth, comparable with the depth of the literature studied • without irrelevant additional information • using correct equations and models for the situation (for example when to use linear or nonlinear models) • using correct units for quantities in equations, graph labels, etc. M AVD WE and M AVD OE: The WarmUp Test result given by the lecturer during the lecturing of the theory determines 20% of the score of the written (re-) exam M AVD WE and 20% of the oral (re-)exam M AVD OE. There are no separate WarmUp Tests for the re-exams.
Information for each exam and modular exam	

Examinations	Exam code	M AVD WE	M AVD OE
		Week 1.9 / 3.9	Week 2.9 / 4.9

Module code **M BDSD**	**Big Data & Small Data**
Degree program	Master Engineering Systems
Target Group	Elective module
Coordinating lecturer	Carolien Kattenbelt
Professional Task	Collect dataset, interpret features of dataset and create prediction model
Professional Products	Models
Credits / Study load	15 EC / 420 hours
Relationship with and entry requirements concerning examinations	Module Systems Modelling
General Description	The module covers the following tasks: • Collect a relevant dataset • Interpret the features of the dataset • Offline create prediction model using either system identification techniques or supervised machine learning • Evaluate the model
Final Qualifications	C1 Analyzing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration C7 Professional development
Units of study	Data Collection and machine learning (7,5 EC) Capita Selecta in Machine learning (2.5 EC) Project Big Data & Small Data (5 EC)

Unit of Study (UoS) **M BDSD T**	**Data Collection and Machine Learning**
General Information	
Name of unit of study	Data Collection and Machine Learning
Code for unit of study	M BDSD T
Teaching Term	Semester 1 / Semester 2
Credits/study load	7,5 EC / 210 hours
Study hours (contact hours)	80 contact hours
Entry requirements	Systems Modelling
Objectives and instructional formats	
Professional task	Analyze a dataset and create a prediction model
(Professional) products	black box model
General description	The students have to carry out assignments in which they learn how to clean up a dataset so that it is directly usable for prediction purposes. Furthermore students will analyze the data within the dataset and find e.g. correlation among variables. The student also learns how to make prediction models using a large number of supervised machine learning algorithms. The student can apply these models to datasets and knows the advantages and disadvantages of the different methods.
Compulsory literature	
Recommended literature	-
Software and other materials	Matlab Simulink
Relationship	Units of study Big Data & Small Data
Compulsory participation	No, but attendance will be registered
Activities and instructional formats	Working on applied assignments using a simulation environment Work forms: Lectures, flipped classroom, assignments
Examinations	
Final Qualifications	C1 Analyzing and defining problems C2 Design C3 Testing
Assessment dimensions / Learning outcomes	Dimensions of assessment: - Knowledge and understanding (Analyzing and defining problems, design and testing algorithms) - Applying knowledge and understanding (design) - Making judgements (testing) The student formulates a question on what they want to achieve with the dataset (BDSD HTE1)

	The student judges if the dataset contains enough data and the data contains the right features to answer the formulated question. He or she knows how to deal with missing or erroneous data and can scale that dataset if necessary and can select test and validation sets (BDSD HTE1) The student interprets the features of the dataset. He or she is able to use clustering techniques line K-means and look for correlation between data and use PCA (BDSD HTE1) The student can apply supervised machine learning techniques for predictive analysis like linear regression, logistic regression and neural networks and motivate why they chose that particular technique. (BDSD HTE1) The student can evaluate and compare models by picking a relevant metric like e.g. R^2. (BDSD HTE1) The student can apply supervised machine learning techniques for predictive analysis like techniques from System Identification. (BDSD HTE2)		
Assessment criteria	The student will be assessed on the criteria (questions) mentioned on the evaluation form. (next page)

Unit of Study (UoS) **M BDSD MP**	**Big data Minor Project**
General Information	
Name of unit of study	Big Data Minor Project
Code for unit of study	M BDSD MP
Teaching Term	Semester 1 / Semester 2
Credits/study load	5 EC / 140 hours
Study hours (contact hours)	32 contact hours and 4 contact hours presentation
Entry requirements	Systems Modelling
Objectives and instructional formats	
Professional task	Create a predictive model
(Professional) products	A predictive model, Project documentation, Presentation
General description	The Project serves to challenge the students to apply their knowledge and skills on a real-life problem, in correspondence with a subset of the final qualifications. The project covers the following topics: - Analyzing data of a real life problem - Developing a prediction model for this problem. The problem analysis will result in a problem solution to be translated in such terms that conclusions can be drawn based on the extent the problem has been solved and objectives fulfilled.
Compulsory literature	• Project Management, A Practical Approach, Roel Grit, Noordhoff Uitgevers, ISBN 9789001790929 • Report Writing for readers with little time, Rien Elling, Bas Andeweg, Noordhoff Uitgevers, ISBN 9789001812591
Recommended literature	-
Software and other materials	Matlab, Simulink, R, python, SPSS
Relationship	Units of study Big Data & Small Data
Compulsory participation	Yes
Activities and instructional formats	Research Work Forms: Lectures, Assignment Analyzing data and creation of a predictive model using techniques from system identification and/or machine learning.
Examinations	

Final Qualifications	C1 Analyzing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration C7 Professional development
Assessment dimensions / Learning outcomes	Dimensions of assessment: - Applying knowledge and understanding (analyzing and defining problems, design, testing, conducting research) - Making judgements (analyzing and defining problems, design, testing, conducting research) - Communication (managing work processes, communication and collaboration) - Learning skills (professional development) Learning outcomes: The student presents a clear justification of the project approach. The student plans effectively. The student carries out a project based on a real-life problem in which model development and analysis as well as experimental validation are essential parts by applying knowledge and understanding and making judgements based on analysis and validation techniques. The student structures the working process in the engineering domain and is able to effectively communicate the core findings in a structured and convincing way. The student is able to systematically search for information, such as e.g. models, and judge its relevance. The student communicates the project findings in a clear and structured manner with colleague, customers and the wider public in oral and written forms. The content has been reviewed by peers and/or supervisor. The student reflects on his/her role in the project and on his/her professional development. The student can make a motivated choice of which machine learning techniques he/she uses. The student can evaluate and compare models by picking a relevant metric like e.g. R^2.
Assessment criteria	The student will be assessed on the criteria mentioned on the evaluation form. To determine the result of the minor project for each student:

	1. **A group mark** will be defined by the examiners. 2. **Peer review**: each minor project group evaluates at least twice the contribution of the group members on content and collaboration. if the outcome of the first peer review is negative for the individual student, the student still has the opportunity to improve. If the result is negative again during the second peer review, the student will not receive a pass and therefore no final grade. 3. **The individual mark** is based on the group mark and the group contribution. The HAN supervisor can make use of the results of the peer review. Students should be aware of their own functioning within the project group, so should arrange peer feedback within their project group regularly.

Module **M DS**	**Distributed Systems**
Degree program	Master Engineering Systems
Target Group	Elective module
Coordinating lecturer	Aart-Jan de Graaf
Professional Task	Design, implement, verify, and test distributed embedded control systems
Professional Products	Report Design Presentation Article
Credits / Study load	15 EC / 420 hours
Relationship with and entry requirements concerning examinations	• A basic level of programming experience, preferably in the C programming language • Systems Modeling
General Description	The module provides an understanding of the principles on which distributed embedded systems are based, such as architectural design, protocols, algorithms, fault handling, and maintenance. The key principle is real-time behavior and how this affects quality requirements (resource limited reasoning). These principles are applied during a minor project that follows the values and principles of agile software development and uses the C programming language.
Final Qualifications	C1 Analyzing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration C7 Professional development
Units of study	Distributed Systems Theory (7.5 EC) Distributed Systems Capita Selecta (2.5 EC) Distributed Systems Minor project (5.0 EC)

Unit of Study (UoS) **M DS T**	**Distributed Systems Theory**
General Information	
Name of unit of study	Distributed Systems Theory
Code for unit of study	M DS T
Teaching Term	Semester 2
Credits/study load	7.5 EC / 210 hours
Study hours (contact hours)	64 contact hours + 3 contact hours exam
Entry requirements	Systems Modelling
Objectives and instructional formats	
Professional task	Design and test distributed embedded control systems
(Professional) products	Architectural design
General description	The course provides the design concepts and principles of distributed embedded systems, such as architectural design, real-time aspects, protocols, fault handling, and maintenance.
Compulsory literature	• Kopetz, H. (2011). *Real-time systems: design principles for distributed embedded applications*. Springer Science & Business Media.
Recommended literature	• Pfeiffer, O., Ayre, A., & Keydel, C. (2016). *Embedded networking with CAN and CANopen*. Copperhill Media. • Tanenbaum, A. S., & Van Steen, M. (2007). *Distributed systems: principles and paradigms*. Prentice-Hall. **https://www.distributed-systems.net/index.php/books/distributed-systems-3rd-edition-2017/**
Required software	Matlab, Simulink
Relationship	Units of study Distributed Systems
Compulsory participation	No, but attendance will be registered
Activities and instructional formats	Self-study, case-studies, working on assignments and exercises Work forms: Lectures, lab exercises
Examinations	
Final Qualifications	C1 Analyzing and defining problems C2 Design C3 Testing
Assessment dimensions / learning outcomes	Dimensions of assessment: Knowledge and understanding (Analyzing and defining problems) Applying knowledge and understanding (Design and Testing) Learning outcomes: • The student is able to relate an abstract design model to a digital implementation of a simple control application

<table>
<tr><td></td><td colspan="3">The student knows how design decisions affect efficiency, scalability, and maintenance of distributed systems.
The student knows time related aspects of real-time behavior, such as order, measurement, synchronization, and scheduling.
The student knows the characteristics of real-time communication and how to use a time-triggered protocol.
The student designs a fault tolerant distributed system.
The student interprets electrical and protocol specifications, such as CAN or FlexRay, and relates this to the design.</td></tr>
<tr><td>Assessment criteria</td><td colspan="3">The student will be assessed on answering the questions (WE):
clearly and to the point, including sufficient relevant explanation and depth, comparable with the depth of the literature studied
without irrelevant additional information
using correct equations and models for the situation (for example when to use linear or nonlinear models)
using correct units for quantities in equations, graph labels, etc.
The student will be assessed (HTE) on the criteria mentioned on the evaluation form.</td></tr>

Unit of Study (UoS) **M DS CS**	**Distributed Systems Capita Selecta**
General Information	
Name of unit of study	Distributed Systems Capita Selecta
Code for unit of study	M DS CS
Teaching Term	Semester 2
Credits/study load	2.5 EC / 70 hours
Study hours (contact hours)	32 contact hours
Entry requirements	Systems Modelling
Objectives and instructional formats	
Professional task	Explore novel developments of distributed systems and their use in contemporary applications.
(Professional) products	Literature study report in the form of an article to inform pear students.
General description	The course explores the use of distributed systems in contemporary applications, such as the Internet of Things, M2M solutions, the cyber physical world, and systems-of-systems. This exploration is achieved by means of a literature study, with literature from papers, articles, blogs and/or other relevant resources. The results are presented in a literature study report.
Compulsory literature	To be decided during class, depending on the subject.
Recommended literature	To be decided during class, depending on the subject.
Software and other materials	-
Relationship	Units of study Distributed Systems
Compulsory participation	No, but attendance will be registered
Activities and instructional formats	Self-study, case studies Work forms: Lectures, interactive simulation exercises, assignments, reporting
Examinations	
Final Qualifications	C5 Conducting research C6 Communication and collaboration
Assessment dimensions / learning outcomes	Dimensions of assessment: - Applying knowledge and understanding (Conducting Research) - Making judgements (conducting research) - Communication (conducting research)

	• The student is aware of distributed systems in one or more contemporary applications. • The student finds and selects relevant scientific resources for a selected topic. • The student determines the validity of a referenced resources. • The student writes a literature study report with a trailer, a main text, a conclusion, a discussion and references. • The student specifies references according a literacy standard.	
Assessment criteria	The student will be assessed on the criteria (questions) on the evaluation form.

Software and other materials	Matlab, simulink, C
Relationship	Units of study Distributed Systems
Compulsory participation	yes
Activities and instructional formats	Two students working together in a group, progress meetings with supervisor
Examinations	
Final Qualifications	C1 Analyzing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration C7 Professional development

Assessment dimensions / Learning outcomes	Dimensions of assessment: - Applying knowledge and understanding (analyzing and defining problems, design, testing, conducting research of principles of distributed systems in C) - Making judgements (analyzing and defining problems, design, testing, conducting research of principles of distributed systems)) - Communication (managing work processes, communication and collaboration) - Learning skills (professional development) Learning outcomes (general): The student presents a clear justification of the project approach. The student plans effectively. The student carries out a project based on a real-life problem in which model development and analysis as well as experimental validation are essential parts by applying knowledge and understanding and making judgements based on analysis and validation techniques. The student structures the working process in the engineering domain and is able to effectively communicate the core findings in a structured and convincing way. The student is able to systematically search for information, such as e.g. models, and judge its relevance. The student communicates the project findings in a clear and structured manner with colleague, customers and the wider public in oral and written forms. The content has been reviewed by peers and/or supervisor. The student reflects on his/her role in the project and on his/her professional development. Learning outcomes (specific): The student applies the values and principles of agile software development. The student designs a distributed embedded system for a given problem description. The student justifies the real-time aspects of the designed distributed embedded system. The student implements the designed distributed embedded system by using the C programing language and selected hardware platforms, tests the design, and demonstrates the realization. The student shows by means of test reports the fault tolerance capabilities of the implemented distributed system. The student reports realistically about efficiency, scalability, and maintenance of the implemented distributed system. The student uses a protocol standard, such as CANopen or FlexRay, for transferring data between embedded systems.

Module **M EHFP**	**Electric, hybrid & fuel cell powertrains**
Degree program	Master Engineering Systems
Target Group	Elective module
Coordinating lecturer	Ad Oomen
Professional Task	Understand, analyze and contribute to innovations in electric hybrid and fuel cell powertrains
Professional Products	Project plan (minor project) Report (minor project) Presentation (minor project) Model (model assignment) Report (model assignment) Presentation (Capita Selecta)
Credits / Study load	15 EC / 420 hours
Relationship with and entry requirements concerning examinations	Applied Control Systems Modelling
General Description	In this module the student will gain knowledge on analyzing innovative powertrains concerning performance, energy efficiency, environmental sustainability, costs or any other relevant aspect. Theory In the theory part the student will gain knowledge of the physics required for analyzing powertrains. The working principals of the powertrain, its subsystems and components will be studied. The student will model powertrains using grey box models. Attention will be paid to relevant control aspects of powertrains regarding optimization of energy efficiency in hybrid systems. The student will learn the physical implications of the concept choices made. Project The student will implement the theory learned in a modelling project having the appropriate level of detail and showing the powertrain layout, relations between components and powertrain output. Validation will be done using experimental data.
Final Qualifications	C1 Analysing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration C7 Professional development
Units of study	This module consists of the following 3 units: Electric hybrid & fuel cell powertrains Theory (7.5 EC) Electric hybrid & fuel cell powertrains Capita Selecta (2.5 EC) Electric hybrid & fuel cell powertrains Minor Project (5 EC)

Unit of Study (UoS) **M EHFP T**	**Electric hybrid & fuel cell powertrains Theory**
General Information	
Name of unit of study	Electric hybrid & fuel cell powertrains Theory
Code for unit of study	M EHFP T
Teaching Term	Semester 1 / Semester 2
Credits/study load	7.5 EC / 210 hours
Study hours (contact hours)	64 contact hours + 6 contact hours exam (2 written exams)
Entry requirements	Systems Modelling / Applied Control
Objectives and instructional formats	
Professional task	Concept design and analysis of innovative hybrid powertrains
(Professional) products	Not applicable
General description	The course covers the following topics: • The vehicle powertrain as a system • Main powertrain functions • Powertrain subsystems and components • Powertrain modelling and model validation • Optimization of energy efficiency • Analysis on environmental sustainability • Control aspects of powertrains
Compulsory literature	• Mehrdad Ehsani, Yimin Gao, Ali Emadi, *Modern Electric, Hybrid Electric, and Fuel Cell Vehicles*, Third edition, ISBN 9781138330498 • Lecturing materials and hand-outs on OnderwijsOnline
Recommended literature	• Lino Guzzella, Antonio Sciarretta, *Vehicle Propulsion systems*, Third edition, Print ISBN 9783642359125 and online ISBN 9783642359132
Required software Required hardware	MATLAB/Simulink, AME-sim Laptop with sufficient internal memory
Relationship	M EHFP CS and M EHFP MP Module: Systems Modelling and Applied Control
Compulsory participation	No, but attendance will be registered
Activities and instructional formats	Lectures, Self-study, Working on assignments
Examinations	
Final Qualifications	C1 Analyzing and defining problems
Assessment dimensions / learning outcomes	Dimensions of assessment: - Knowledge and understanding (analyzing and defining problems) The student analyzes advanced and innovative configurations of a complete vehicle powertrain and is able to make conceptual design choices concerning it.

	The student uses relevant white box or grey box modelling methods to determine the physical model of a vehicle powertrain. The student understands relevant control aspects of powertrains regarding optimization of energy efficiency. (WE1 and WE2) The student is able to analyze a problem in the field of automotive powertrains by using state of the art Computer Aided Engineering (CAE) tools. The student is able to create an optimized solution for an automotive powertrain. (HTE)			
Assessment criteria	The student will be assessed on answering the questions: • clearly and to the point, including sufficient relevant explanation and depth, comparable with the depth of the literature studied • without irrelevant additional information • using correct equations and models for the situation (for example when to use linear or nonlinear models) • using correct units for quantities in equations, graph labels, etc. M EHFP WE1 and WE2: The WarmUp Test result given by the lecturer during the lecturing of the theory determines 20% of the score of the written (re-) exams. ***For re-exams the WarmUp Test result of the previous attempt no longer counts.'***

Relationship	M EHFP T and M EHFP CS Units of study Systems Modelling
Compulsory participation	Yes
Activities and instructional formats	Research Work Forms: Assignment
Examinations	
Final Qualifications	C1 Analyzing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration

	C7 Professional development
Assessment dimensions / learning outcomes	Dimensions of assessment - Applying knowledge and understanding (analyzing and defining problems, design, conducting research) - Making judgements (analyzing and defining problems, Design, Conducting Research - Communication (managing work processes, communication and collaboration) - Learning skills (professional development) Learning outcomes: The student presents a clear justification of the project approach. The student plans effectively. The student carries out a project based on a real-life problem in which model development and analysis as well as experimental validation are essential parts by applying knowledge and understanding and making judgements based on analysis and validation techniques. The student structures the working process in the engineering domain and is able to effectively communicate the core findings in a structured and convincing way. The student is able to systematically search for information, such as e.g. models, and judge its relevance. The student communicates the project findings in a clear and structured manner with colleague, customers and the wider public in oral and written forms. The content has been reviewed by peers and/or supervisor. The student reflects on his/her role in the project and on his/her professional development. The student is able to analyze a real life problem concerning powertrains. The student is able to create a model for a powertrain problem and to perform a relevant analysis. The student is able to validate modelling results against the real-life situation and problem definition. The student is able to formulate a proposal for improvement of a powertrain problem and is able to make an assessment of its viability taking into account energy efficiency and environmental sustainability using proper techniques like prototyping, modelling or analysis.
Assessment criteria	The student will be assessed on the criteria mentioned on the evaluation form.

	To determine the result of the minor project for each student: 1. **A group mark** will be defined by the examiners. 2. **Peer review**: each minor project group evaluates at least twice the contribution of the group members on content and collaboration. if the outcome of the first peer review is negative for the individual student, the student still has the opportunity to improve. If the result is negative again during the second peer review, the student will not receive a pass and therefore no final grade. 3. **The individual mark** is based on the group mark and the group contribution. The HAN supervisor can make use of the results of the peer review. Students should be aware of their own functioning within the project group, so should arrange peer feedback within their project group regularly.

Module **M HT2**	**Hydrogen Technology**
Degree program	Master Engineering Systems
Target Group	Elective module (Automotive Systems, Sustainable Energy)
Coordinating lecturer	Bram Veenhuizen
Professional Task	Understand, analyze and contribute to technical and societal aspects of hydrogen technology and the interactions.
Professional Products	Project plan (project) Report (project and capita selecta) Presentation (progress and final) Test plan and test report (project) if appropriate
Credits / Study load	15 EC / 420 hours
Relationship with and entry requirements concerning examinations	Module Systems Modelling Module Applied Control
General Description	The Module H2 focuses on the role hydrogen can play in the energy transition. We will mainly focus on decentralized systems, ranging from electrolysers and fuel cell stacks to internal combustion engines running on hydrogen. System design, integration and control will be important aspects, but also safety and other standards will be addressed. A separate course on safe working with hydrogen is part of the module. Applications will range from static sustainable energy storage to mobile applications in cars, trucks and inland shipping. All main design aspects will be covered, mainly by using model based design techniques. The student will get familiar with analyzing and performing technical- and economical calculations on energy systems. Next to that the student will learn how to apply and understand relevant state-of-the art scientific literature. The students will work in a project to apply the knowledge, application skills and insights acquired during the lectures. The student will get the opportunity to perform lab experiments.
Final Qualifications	C1 Analyzing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration C7 Professional development
Units of study	Hydrogen Technology Theory (7.5 EC) Hydrogen Technology Capita Selecta (2.5 EC) Hydrogen Technology Project (5 EC)

Unit of Study (UoS) **M HT2 T**	**Hydrogen Technology theory**
General Information	
Name of unit of study	Hydrogen Technology Theory
Code for unit of study	M HT2 T
Teaching Term	Semester 2
Credits/study load	7.5 EC / 210 hours
Study hours (contact hours)	64 contact hours + 6 contact hours exam (written exam WE 1 / 2)
Entry requirements	Systems Modelling / Applied Control
Objectives and instructional formats	
Professional task	Concept design and analysis of engines and fuels
(Professional) products	Concept level design engineer for decentralized hydrogen based systems. Test engineer for hydrogen based systems Analyze and disseminate Sustainable Energy Technology & Energy systems modelling and understand energy- and environmental policy and regulation implications.

General description	The course Hydrogen technology covers the following topics:
	• Role of hydrogen in the energy transition
	  ○ Storage (MH, LH2, LOHC, …)
	• Applications of hydrogen
	• Hydrogen systems
	  ○ (engines, combustion, FC, DCDC, heaters, etc.)
	  ○ Modeling
	  ○ Energy management
	  ○ sizing
	• Safety course on working with hydrogen
	• Rules and regulations
	  ○ Automotive
	  ○ Stationair
	• Hydrogen sources
	  ○ Electrolysis
	  ○ Gas reforming
	  ○ Biological sources
	• Aspects of Process technology
	• Electrochemistry and thermodynamics
	  ○ Bindingsenthalpie
	  ○ Catalyse
	  ○ Elektroliet
	• Heat production and use
	• System durability

Compulsory literature	Fuel Cell Handbook / 7th Edition 2004 Lecturing materials and hand-outs on Onderwijs Online
Recommended literature	Not applicable
Required software	Matlab Simulink / GT Power
Relationship	M HT2 CS and M HT2 MP
Compulsory participation	No, but attendance will be registered
Activities and instructional formats	Self-study, discussion of literature, assignments and exercises.
Examinations	
Final Qualifications	C1 Analyzing and defining problems
Assessment dimensions / learning outcomes	Dimensions of assessment: • Knowledge and understanding (analyzing and defining problems), analysis, fundamentals and applications Learning outcomes: The student • has developed knowledge and understanding of the fundamentals of hydrogen, its practical applications and its role in the energy transition. • Is able design on a concept level, able to analyze and suggest improvements on system level for hydrogen based energy systems • Can apply rules and regulations for system design • Has practical knowledge on how to work with hydrogen according to safety regulations
Assessment criteria	The student will be assessed on answering the questions: • Clearly and to the point, including sufficient relevant explanation and depth, comparable with the depth of the literature studied • Without irrelevant additional information • Using correct equations and models for the situation There is a separate modelling assignment given by the lecturer during the lecturing of the modelling subject within the course. The assignment is examined by the examiner familiar with the modelling subject.

Unit of Study (UoS) **M HT2 MP**	**Hydrogen Technology Minor Project**
General Information	
Name of unit of study	Hydrogen Technology Minor Project
Code for unit of study	M HT2 MP
Teaching Term	Semester 2
Credits/study load	5 EC / 140 hours
Study hours (contact hours)	32 contact hours and 4 contact hours presentation
Entry requirements	Systems Modelling / Applied Control
Objectives and instructional formats	
Professional task	The professional task consists of: - Design a hydrogen based Energy system, make a model and simulate output - Perform tests on a hydrogen based energy system - Determine economic and social, legal viability and safety of hydrogen based energy system(s)
(Professional) products	Project plan, Report and Presentation/Defence
General description	The Project serves to challenge the students to apply their knowledge and skills on a real-life problem, in correspondence with a subset of the final qualifications. The project covers the following topics: • The problem to be solved requires an understanding and active analysis of distinctive disciplines. • The project will always include the step from a real-life problem to a more abstract representation of the problem. Required results are described under the professional product section. The problem analysis will result in a problem solution to be translated in such terms that conclusions can be drawn based on the extent the problem has been solved and objectives fulfilled.
Compulsory literature	Project Management, A Practical Approach, Roel Grit, Noordhoff Uitgevers, ISBN 9789001790929 Report Writing for readers with little time, Rien Elling, Bas Andeweg, Noordhoff Uitgevers, ISBN 9789001812591
Recommended literature	-
Software and other materials	Matlab simulink, GT Power
Relationship	M HT2 T and M HT2 CS
Compulsory participation	Yes
Activities and instructional formats	Research Work Forms: Lectures, Assignment

Examinations	
Final Qualifications	C1 Analyzing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration C7 Professional development
Assessment dimensions / Learning outcomes	Dimensions of assessment - Applying knowledge and understanding (Analyzing and defining problems, Design, Conducting Research) - Making judgements (Analyzing and defining problems, Design, Conducting Research - Communication (managing work processes, communication and collaboration) - Learning skills (professional development) **Learning outcomes (general):** The student presents a clear justification of the project approach. The student plans effectively. The student carries out a project based on a real-life problem in which model development and analysis as well as experimental validation are essential parts by applying knowledge and understanding and making judgements based on analysis and validation techniques. The student structures the working process in the engineering domain and is able to effectively communicate the core findings in a structured and convincing way. The student is able to systematically search for information, such as e.g. models, and judge its relevance. The student communicates the project findings in a clear and structured manner with colleague, customers and the wider public in oral and written forms. The content has been reviewed by peers and/or supervisor. The student reflects on his/her role in the project and on his/her professional development. **Learning outcomes (specific):** The student can critique on and analysis of problems in the field of energy system design, system simulation and testing, feasibility study. The student evaluates energy models and make informed decisions based on scenario information.

	The student creates a proposal for improvement on an analyzed and evaluated energy system or plan a new design for an energy system; taking into account use of renewable resources, energy efficiency and environmental sustainability.		
Assessment criteria	The student will be assessed on the criteria mentioned on the evaluation form. To determine the result of the minor project for each student: 4. **A group mark** will be defined by the examiners. 5. **Peer review**: each minor project group evaluates at least twice the contribution of the group members on content and collaboration. if the outcome of the first peer review is negative for the individual student, the student still has the opportunity to improve. If the result is negative again during the second peer review, the student will not receive a pass and therefore no final grade. 6. **The individual mark** is based on the group mark and the group contribution. The HAN supervisor can make use of the results of the peer review. Students should be aware of their own functioning within the project group, so should arrange peer feedback within their project group regularly.

Module **M PCD**	**Process Development**
Degree program	Master Engineering Systems
Target Group	Elective module
Coordinating lecturer	Stef Tiggeloven
Professional Task	(Re-)design and improve manufacturing processes
Professional Products	(Re-)design and improvement of manufacturing processes
Credits / Study load	15 EC / 420 hours
Relationship with and entry requirements concerning examinations	Simultaneously to the Module Systems Modelling or after taking classes Systems Modelling
General Description	In this module students will learn and apply lean principles and methods for the design, operational control and improvement of manufacturing processes. The focus of the module is on the design and planning & control of manufacturing system. The use of new technology to support Lean Manufacturing plays an important role in the module: as well new manufacturing as Industry 4.0 technologies. Students will gain the knowledge and ability to apply important Lean principles, methods and techniques, in combination new technologies, to (re-)design manufacturing processes. Discrete simulation, supporting the modelling and analysis of a system, is part of the course as well as the quality control methods. Next to this, students will gain knowledge on various top-down and bottom-up Continuous Improvement methods and tools (routines) to be applied in manufacturing companies. Students will apply this knowledge in an improvement project in industry related projects where they use the (PDCA) A3 methodology and reporting method. This methodology consists of context analysis, describing the current state, formulating objectives, future state design, implementation planning and follow-up design. Students will also learn to search for relevant scientific literature which supports their improvement project. They will learn to link this literature to practice.
Final Qualifications	C1 Analyzing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration C7 Professional development
Units of study	Process development: Operations Design/Operations Planning and Control (4 EC/3.5 EC)) Capita Selecta (2.5 EC) and the minor project (5 EC)

Unit of Study (UoS) **M PCD OD**	**Process Development Operations Design**

Teaching Term	Semester 1 / semester 2
Credits/study load	2.5 EC / 70 hours
Study hours (contact hours)	32 contact hours
Entry requirements	After taking classes Systems Modelling and Applied Control
Objectives and instructional formats	
Professional task	Linking scientific literature on technological developments to practical, operations management, topics.
(Professional) products	Documentation of the work in short reports and presentations
General description	In the Capita Selecta, students will study scientific literature and link this to the elements in the courses Operations Design, Operations Planning & Control. Ideally on elements of their minor project. The topics concerns the impact of technology on operations design and operations planning & control. Students will learn to present their (new) insights in a paper, short reports as well as in presentations.
Compulsory literature	To be decided during class, depending on the subject.
Recommended literature	To be decided during class, depending on the subject.
Software and other materials	-
Relationship	Units of study Process Development
Compulsory participation	Attendance will be registered; at least joined 6 (out of 10) Capita Selecta presentations.
Activities and instructional formats	Study lectures, literature research, writing reports and presenting.
Examinations	
Final Qualifications	C5 Conducting research
Assessment dimensions / learning outcomes	Dimensions of assessment: - Knowledge and understanding (conducting research) - Communication (Clear reports and presentations) The student is able to study scientific literature and link this to the elements in the field of Operations Design and Operations Planning & Control.

	The student is able to present their (new) insights in short reports as well as in presentations. The student is able to understand specialized applied scientific knowledge in relevant topics concerning the impact of manufacturing and Industry 4.0 (Smart Industry) technologies on Operations Design and Planning & Control. Students are able to understand technology elements in the field of Process Improvement.	
Assessment criteria	The student will be assessed on the criteria mentioned on the evaluation form. (next page)

The student communicates the project findings in a clear and structured manner with colleague, customers and the wider public in oral and written forms. The content has been reviewed by peers and/or supervisor. The student reflects on his/her role in the project and on his/her professional development. The student is able to carry out an assignment on the (re-)design or improvement of a product profiling in a company, including a related literature survey.
Assessment criteria	The student will be assessed on the criteria mentioned on the evaluation form. To determine the result of the minor project for each student: 1. **A group mark** will be defined by the examiners. 2. **Peer review**: each minor project group evaluates at least twice the contribution of the group members on content

<table>
<tr><td></td><td colspan="3">and collaboration. if the outcome of the first peer review is negative for the individual student, the student still has the opportunity to improve. If the result is negative again during the second peer review, the student will not receive a pass and therefore no final grade.
3. The individual mark is based on the group mark and the group contribution. The HAN supervisor can make use of the results of the peer review.

Students should be aware of their own functioning within the project group, so should arrange peer feedback within their project group regularly.</td></tr>

PCD: Project Documentation and Presentation, Evaluation and Awarding Marks

Name, first name……

	Mark	Motivation	Weight factor
Applying knowledge and understanding **C1: Analyzing and defining problems** **C2: Design** **C3: Testing** **C5: Conducting Research** Applies adequate principles and methods when describing the context of process improvement. In this way it is convincing for stakeholders and others. Applies adequate methods to describe the current way of working and provides meaningful data and information.			1
Making judgments **C1: Analyzing and defining problems** **C2: Design** **C3: Testing** **C5: Conducting Research** Applies adequate analysis methods and knows how to position the results well within the organization. Applies good methods and principles when redesigning the process. Adequately motivates the choice of methods and principles. Makes informed choices from alternatives. Know how to identify the gap between the current situation and the desired situation. Formulates a sensible change strategy, taking into account the different stakeholders. Acts adequately with regard to the capacity for change and support for change in the organization.			1
Communication **C4: Managing work processes** **C6: Communication and Collaboration** Is the student able to present the results to a problem owner? Is the text clearly understandable and in grammatically sound language? Have the formal requirements for literary sources been met?			1
Learning Skills **C7: Professional development** Does the student display discernible eagerness to tackle the task? Is the problem owner involved adequately? Does the student show problem solving skills? Is the student self-reliant?			1
Mark total For a pass all items should be sufficient			

Date : Signature examiner , Signature examiner

Module **M PDD**	**Product Development**
Degree program	Master Engineering Systems
Target Group	Elective module
Coordinating lecturer	Jannes Slomp
Professional Task	(Re-)design and improve products and/or development processes
Professional Products	Improved development processes and/or new or improved product designs
Credits / Study load	15 EC / 420 hours
Relationship with and entry requirements concerning examinations	After taking classes Systems Modelling and Applied Control
General Description	In this module students will learn and apply lean principles and methods in the design and improvement of products. They will gain a broad and deep knowledge in several product design and development topics, such as opportunity identification, product planning, concept generation and selection, product architecture, DfX methods and important tools like Quality Function Deployment and Value Engineering. FFD and MFD strategy, operations design, project planning and control, opportunity identification and the role of technology in the improvement of products. They will learn what lean concepts and methods are that can be used in product development and design. They will apply this knowledge in an improvement project in the industry where they use the (PDCA) A3 methodology and reporting method.
Final Qualifications	C1 Analyzing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration C7 Professional development
Units of study	Product Design (4 EC) Product Development Processes (3.5 EC) Capita Selecta (2.5 EC) Minor Project Product Development (5 EC)

Unit of Study (UoS) **M PDD PD**	**Product Design**
General Information	
Name of unit of study	Product Design
Code for unit of study	M PDD PD
Teaching Term	Semester 2
Credits/study load	4 EC / 112 hours
Study hours (contact hours)	32 contact hours + 3 contact hours exam
Entry requirements	after taking classes Systems Modelling
Objectives and instructional formats	
Professional task	Application of key methods in the analysis and improvement of the architecture of a product
(Professional) products	Not applicable
General description	The course focuses on the analysis and re-design of the architecture of a current product design. The course contains the following topics: • Customer Value • Product Architecture Mapping • Quality Function Deployment • Modularity Function Deployment • Commonality and Platfoms • Design for Six Sigma • Requirement management • DFX • Value Analysis • Portfolio analysis • Life cycle analysis • Circular designs
Compulsory literature	• Karl Ulrich, Steven Eppinger, and Maria C. Yang (2020). Product Design and Development 7th Edition, McGrawHill, ISBN-13: 978-1260043655; ISBN-10: 1260043657 • Presentations and papers used in the classes, Reader
Recommended literature	-
Required software	-
Relationship	Units of study Product Development
Compulsory participation	No, but attendance will be registered
Activities and instructional formats	Self-study, Working on assignments and exercises Work Forms: Lectures

Examinations		
Final Qualifications	C1 Analyzing and defining problems with respect to the architecture of a product C2 Design (specification) of a product design improvement project	
Assessment dimensions / learning outcomes	Dimensions of assessment: • Knowledge and understanding (analyzing and defining problems) of product architecture mapping • Applying Knowledge and understanding: Application of Product Architecture Mapping for the analysis and improvement of existing products The student is able to analyze product architectures and to specify improvement challenges	
Assessment criteria	The student will be assessed on answering the questions: • clearly and to the point, including sufficient relevant explanation and depth, comparable with the depth of the literature studied • without irrelevant additional information • using correct equations and models for the situation (for example when to use linear or nonlinear models) • using correct units for quantities in equations, graph labels, etc.	
Information for each exam and modular exam		
Examinations	Exam code	M PdD PD WE
		Week 3.9

Unit of Study (UoS) **M PDD PDP**	**Product Development Processes**
General Information	
Name of unit of study	Product Development Processes
Code for unit of study	M PDD PDP
Teaching Term	Semester 2
Credits/study load	3.5 EC / 98 hours
Study hours (contact hours)	32 contact hours and 3 hours written exam
Entry requirements	after taking classes Systems Modelling and Applied Control
Objectives and instructional formats	
Professional task	Application of Product Design and Development principles and methods
(Professional) products	Not applicable
General description	The course focuses on the analysis and development of efficient and effective processes for product design and development. The course contains the following topics: • Strategy building & deployment • Technology Roadmapping • Business performance management • Project portfolio management • Product Development Economics. • Technology Roadmapping • Project Management, • Visual management (Obeya) • Organizational models • Development processes (e.g. stage gate, agile) • Value proposition design • Developing and identification of design opportunities • Rapid learning cycles • Set based development • Concept generation, selection and testing • Industrial Design • Lean Startup • Prototyping • Robust Design • Patents and Intellectual Property • Knowledge management, trade-off curves • Structured Problem Solving / A3 management
Compulsory literature	Readers, papers and presentations used in the classes
Recommended literature	-
Software and other materials	-
Relationship	Units of study Product Development

Compulsory participation	No, but attendance will be registered	
Activities and instructional formats	Self-study, Working on assignments Work Forms: Lectures	
Examinations		
Final Qualifications	C1 Analyzing and defining problems with respect to product design and development C2 Developing the process for efficient and effective product design and development	
Assessment dimensions / learning outcomes	Dimensions of assessment: • Knowledge and understanding (analyzing and defining problems) • Applying Knowledge and understanding: Application of (lean) methods for designing processes for product design and development The student is able to analyze processes for product design and development and to develop an appropriate process for the development of new products	
Assessment criteria	The student will be assessed on answering the questions: • clearly and to the point, including sufficient relevant explanation and depth, comparable with the depth of the literature studied • without irrelevant additional information • using correct equations and models for the situation (for example when to use linear or nonlinear models) • using correct units for quantities in equations, graph labels, etc.

Unit of Study (UoS) **M PDD CS**	**Product Development Capita Selecta**
General Information	
Name of unit of study	Product Development Capita Selecta
Code for unit of study	M PDD CS
Teaching Term	Semester 2
Credits/study load	2.5 EC / 70 hours
Study hours (contact hours)	32 contact hours
Entry requirements	after taking classes Systems Modelling and Applied Control
Objectives and instructional formats	
Professional task	Linking scientific literature on technological developments to processes and methods used in product development.
(Professional) products	Documentation of the work in short reports and presentations
General description	In the Capita Selecta, students will study scientific literature and link this to the elements in the courses Product Architecture Mapping and Product Design and Development and/or elements of their minor project. The topics concerns the impact of technology on (lean) product development. Students will learn to present their (new) insights in short reports as well as in presentations.
Compulsory literature	To be decided during class, depending on the subject.
Recommended literature	To be decided during class, depending on the subject.
Software and other materials	-
Relationship	Units of study Product Development
Compulsory participation	Attendance will be registered; at least joined 6 (out of 10) Capita Selecta meetings
Activities and instructional formats	Study lectures, literature research, writing reports and presenting.
Examinations	
Final Qualifications	C5 Conducting research
Assessment dimensions / learning outcomes	Dimensions of assessment: - Knowledge and understanding (conducting research) - Communication (Clear reports and presentations) The student is able to study scientific literature and link this to the elements in the field of de impact of smart technology

	(smart products) on the process and methods of product development. The student is able to present their (new) insights in short reports as well as in presentations.	
Assessment criteria	The student will be assessed on the criteria mentioned on the evaluation form. (next page)

Unit of Study (UoS) **M PDD MP**	**Product Development Minor Project**
General Information	
Name of unit of study	Product Development Minor Project
Code for unit of study	M PDD MP
Teaching Term	Semester 2
Credits/study load	5 EC / 140 hours
Study hours (contact hours)	32 contact hours and 4 contact hours presentation
Entry requirements	after taking classes Systems Modelling and Applied Control
Objectives and instructional formats	
Professional task	Design and/or Analysis & Improvement of a product or development process Integrating technological knowledge.
(Professional) products	Report Presentation
General description	Students have to carry out an assignment on the (re-)design or improvement of a product. Example projects: • Development of a modular design for a heat recovery ventilation system • Standardization of designs for vacuum chambers • Optimization of agile processes for physical product development • Development of products used in a circular economy
Compulsory literature	Papers, readers and presentations of the related topic, used in the master module
Recommended literature	-
Software and other materials	-
Relationship	Units of study Product Development
Compulsory participation	Yes
Activities and instructional formats	Research Work Forms: Lectures, Assignment
Examinations	
Final Qualifications	C1 Analyzing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration C7 Professional development

Assessment dimensions / learning outcomes	Assessment dimensions: Applying knowledge and understanding (Analyzing and defining problems, Design, Conducting Research) Making judgements (Analyzing and defining problems, Design, Conducting Research Communication (Managing work processes, Communication and Collaboration) Learning skills (Professional development) Learning outcomes: The student presents a clear justification of the project approach. The student plans effectively. The student carries out a project based on a real-life problem in which model development and analysis as well as experimental validation are essential parts by applying knowledge and understanding and making judgements based on analysis and validation techniques. The student structures the working process in the engineering domain and is able to effectively communicate the core findings in a structured and convincing way. The student is able to systematically search for information, such as e.g. models, and judge its relevance. The student communicates the project findings in a clear and structured manner with colleague, customers and the wider public in oral and written forms. The content has been reviewed by peers and/or supervisor. The student reflects on his/her role in the project and on his/her professional development. The student is able to systematically translate a lean engineering problem to a model at an abstract level, i.e. reducing it to its essentials in terms of model framework and problem requirements and to validate results against the real life situation and problem formulation. Through a careful root cause analysis, he is able to formulate the key design problems and a methodology to cope with these problems. He recognizes opportunities to integrate technical innovations in the improvements. He is able to develop alternative solutions and to apply a solid selection method.
Assessment criteria	The student will be assessed on the criteria mentioned on the evaluation form. To determine the result of the minor project for each student: 1. **A group mark** will be defined by the examiners.

	2. **Peer review**: each minor project group evaluates at least twice the contribution of the group members on content and collaboration. if the outcome of the first peer review is negative for the individual student, the student still has the opportunity to improve. If the result is negative again during the second peer review, the student will not receive a pass and therefore no final grade. 3. **The individual mark** is based on the group mark and the group contribution. The HAN supervisor can make use of the results of the peer review. Students should be aware of their own functioning within the project group, so should arrange peer feedback within their project group regularly.

Module code **M SES**	**Sustainable Energy Systems**
Degree program	Master Engineering Systems
Target Group	Elective module
Coordinating lecturer	Rik Catau
Professional Task	Understand and design Sustainable Energy Systems
Professional Products	Models
Credits / Study load	15 EC / 420 hours
Relationship with and entry requirements concerning examinations	Simultaneously to the Module Systems Modelling or after taking classes Systems Modelling
General Description	During the Module SES the student will learn about the broad range of renewable energy generation options that exist. The student will get familiar with analyzing and performing technical- and economical calculations on energy systems. Also incorporated are storage applications which have a rapidly increasing role in such systems. The connection of renewables and storage to the electrical energy grid and discussion of their role within it is part of this module. Next to that the student will become familiar with the policy context because the increase in renewable energy applications is for most part politically driven. The student will also learn about environmental aspects as well interaction between actors which can be complex for energy systems. Next to that the student will learn how to apply and understand relevant state-of-the art scientific literature. The students will work in a project to apply the knowledge, application skills and insights acquired during the lectures.
Final Qualifications	C1 Analyzing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration C7 Professional development
Units of study	Sustainable Energy Systems Theory (7.5 EC) Capita Selecta (2.5 EC) Energy Project (5 EC)

Unit of Study (UoS) **M SES T**	**Sustainable Energy Systems Theory**
General Information	
Name of unit of study	Sustainable Energy Systems Theory
Code for unit of study	M SES T
Teaching Term	Semester 1 / Semester 2
Credits/study load	7.5 EC / 210 h.
Study hours (contact hours)	64 hours + 6 contact hours exam (2 written exams)
Entry requirements	Systems Modelling
Objectives and instructional formats	
Professional task	Analyze and disseminate Sustainable Energy Technology & Energy systems modelling and understand energy- and environmental policy and regulation implications.
(Professional) products	-

General description	The course sustainable energy systems technology gets the student familiar with several sustainable energy technologies. It covers the following topics:
	
	- Electrical energy generation
	  o Overview of energy generation technologies
	  o Solar energy (PV & CSP)
	  o Wind energy
	- Storage & conversion of electrical energy
	  o Overview of grid storage technologies
	  o Battery storage
	  o Hydrogen applications
	
	The course sustainable energy systems integration covers the following topics:
	
	- Modelling, scenarios & application of energy
	  o Explore existing modelling tools for creating future scenarios
	  o Introduction into energy modeling of moderate complexity
	- Heat applications
	  o Conventional thermal generation & biomass
	  o Waste heat & heat storage
	  o Heat pump systems & cooling.
	  o Applications in the built environment & industry
	- Environment, emissions & regulation:
	  o Emission calculations & protocols such as the European Emission Trading System (ETS)
	  o Emission verification

	○ Overview policy instruments & outlook - Markets & stakeholders: ○ Introduction to electricity markets ○ Energy market overview, business and geopolitical implications ○ Stakeholder, who are the main relevant stakeholders
Compulsory literature	Energy Survival guide Insight and Outlook / 1th Edition 2011 Author, J. Hermans, Publisher: Leiden Publications ISBN 9789087281236 Fuel Cell Handbook / 7th Edition 2004 US Department of Energy, Department of Fossil Energy https://www.netl.doe.gov/File%20Library/research/coal/energy%20systems/fuel%20cells/FCHandbook7.pdf Handouts
Recommended literature	Not applicable
Required software	Relevant software will be made available (a.o. EnergyTransitionModel)
Relationship	Units of study Sustainable Energy Systems
Compulsory participation	Attendance will be registered for regular classes and contact moment.
Activities and instructional formats	Self-study, discussion of literature, assignments and exercises.
Examinations	
Final Qualifications	C1 Analyzing and defining problems
Assessment dimensions / learning outcomes	M SES T WE assessment dimensions: • Knowledge and understanding: analysis, fundamentals and applications Learning outcomes: • The student has developed knowledge and understanding of the fundamentals of sustainable energy systems and its applications. • Is able to apply, analyze and evaluate wind- & solar energy and storage applications problems • Is able to apply, analyze and evaluate thermal energy conversion and CO2 emissions & emissions trading system problems, general energy policy questions, and can distinguish and make relevant observations on stakeholder problems.

	• Can distinguish (engineering) bottlenecks in an energy system and propose improvements to the system. • The student has developed an understanding of the societal impact of sustainable energy and the context of regulations. M SES T HTE assessment dimensions: • Knowledge and understanding: analysis, fundamentals and applications Learning outcomes: • The student is able to use energy modelling to formulate strategies and work on moderately complex energy scenario problems in the form of an assignment • The student is able to compare and draw conclusions on the outcomes of an assignment on moderately complex energy scenario problems
Assessment criteria	M SES T WE The student will be assessed on answering the questions: • Clearly and to the point, including sufficient relevant explanation and depth, comparable with the depth of the literature studied • Without irrelevant additional information • Using correct equations and models for the situation (for example when to use linear or nonlinear models) • Using correct units for quantities in equations, graph labels, etc. M SES T HTE There is a separate modelling assignment given by the teacher during the teaching of the modelling subject within the sustainable energy systems integration course. The assignment is examined by the examiner familiar with the modelling subject. Criteria assessed in the assignment made by the student are: • Strategies are well formulated, consistent and contain sufficient variables per strategy • Scenarios are established based on strategies containing explained choices and sufficient detail • The comparison between the scenarios and discussion and conclusions are formulated clearly • Judgements and decisions are supported and reporting is concise, complete, unambiguous and readable

Unit of Study (UoS) M SES CS	**Capita Selecta**
General Information	
Name of unit of study	Capita Selecta
Code for unit of study	M SES CS
Teaching Term	Semester 1 / Semester 2
Credits/study load	2.5 EC / 70 hours
Study hours (contact hours)	32 contact hours + 1 hour presentation
Entry requirements	Systems Modelling
Objectives and instructional formats	
Professional task	Studying scientific Literature on the relevant and actual subjects
(Professional) products	Presentation on subject
General description	Relevant literature is provided and papers are discussed in a journal club.
Compulsory literature	Handouts and papers
Recommended literature	-
Software and other materials	-
Relationship	Units of study Sustainable Energy Systems
Compulsory participation	Presence at colloquia, journal club meetings and presentations is mandatory.
Activities and instructional formats	Self-study, discussion of literature. Work Forms: Lectures, Colloquia and Journal Club
Examinations	
Final Qualifications	C5 Conducting research
Assessment dimensions / learning outcomes	Assessment dimensions • Knowledge and understanding: analysis, fundamentals and applications • Application and making judgments: structuring of research, design and testing • Communication of knowledge; oral and in the form of a presentation Learning outcomes: The student is able to understand scientific literature and presents and discusses the contents with fellow students while providing a relevant context.

Assessment criteria	The student will be assessed on the criteria (the questions) mentioned on an evaluation form which will be provided as part of the course material, which will be used as input for the final evaluation which is included on the next page.

Unit of Study (UoS) **M SES MP**	**Sustainable Energy Systems Minor Project**
General Information	
Name of unit of study	Sustainable Energy Systems Minor Project
Code for unit of study	M SES MP
Teaching Term	Semester 1 / Semester 2
Credits/study load	5 EC / 140 hours
Study hours (contact hours)	32 contact hours and 4 contact hours presentation
Entry requirements	Systems Modelling
Objectives and instructional formats	
Professional task	The professional task consists of: - Design an Energy system, make a model and compute output - Determine economic and social, legal viability of energy system(s)
(Professional) products	An intermediate project report on the design of an energy system including modelling & computation of its output. A final project report on one or multiple (sustainable) energy systems regarding economic, social and legal feasibility.
General description	The Project serves to challenge the students to apply their knowledge and skills on a real-life problem, in correspondence with a subset of the final qualifications. It will be given in two parts: part one focuses on the sustainable energy technology. Part two focuses on the sustainable Energy Systems Integration. The project covers the following topics: • The problem to be solved requires an understanding and active analysis of distinctive disciplines. • The project will always include the step from a real-life problem to a more abstract representation of the problem. Required results are described under the professional product section. The problem analysis will result in a problem solution to be translated in such terms that conclusions can be drawn based on the extent the problem has been solved and objectives fulfilled.
Compulsory literature	Project Management, A Practical Approach, Roel Grit, Noordhoff Uitgevers, ISBN 9789001790929

	Report Writing for readers with little time, Rien Elling, Bas Andeweg, Noordhoff Uitgevers, ISBN 9789001812591
Recommended literature	-

Relationship	Units of study Sustainable Energy Systems
Compulsory participation	Yes
Activities and instructional formats	Research Work Forms: Lectures, Assignment Development and analysis of (sustainable) energy system(s) by working on a problem with fellow student.
Examinations	
Final Qualifications	C1 Analyzing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration C7 Professional development
Assessment dimensions / learning outcomes	Dimensions of assessment: • Knowledge and understanding: analysis, fundamentals and applications • Application and making judgments: structuring of research, design and testing • Communication of knowledge; oral and in the form of a presentation and in a report • Conducting research and generating working hypotheses • Organizing work processes and implementing communication and collaboration • Learning skills (professional development) Learning outcomes (general): • The student presents a clear justification of the project approach. • The student plans effectively. • The student carries out a project based on a real-life problem in which model development and analysis as well as experimental validation are essential parts by applying

	knowledge and understanding and making judgements based on analysis and validation techniques. • The student structures the working process in the engineering domain and is able to effectively communicate the core findings in a structured and convincing way. • The student is able to systematically search for information, such as e.g. models, and judge its relevance. • The student communicates the project findings in a clear and structured manner with colleague, customers and the wider public in oral and written forms. The content has been reviewed by peers and/or supervisor. • The student reflects on his/her role in the project and on his/her professional development. Learning outcomes (specific): • The student can critique on and analysis of problems in the field of energy system design, system simulation and testing, feasibility study. • The student evaluates energy models and make informed decisions based on scenario information. • The student creates a proposal for improvement on an analyzed and evaluated energy system or plan a new design for an energy system; taking into account use of renewable resources, energy efficiency and environmental sustainability.
Assessment criteria	The student will be assessed on the criteria mentioned on the evaluation form. To determine the result of the minor project for each student: 1. **A group mark** will be defined by the examiners. 2. **Peer review**: each minor project group evaluates at least twice the contribution of the group members on content and collaboration. if the outcome of the first peer review is negative for the individual student, the student still has the opportunity to improve. If the result is negative again during the second peer review, the student will not receive a pass and therefore no final grade. 3. **The individual mark** is based on the group mark and the group contribution. The HAN supervisor can make use of the results of the peer review. Students should be aware of their own functioning within the project group, so should arrange peer feedback within their project group regularly.

Information for each exam and modular exam			
Examinations	Exam code	M SES MP GC	M SES MP DP
		Week 2.10 / 4.10	
	First examiners: Rik Catau, Marc v.d. Sluijs, Leon Bunthof		
	Exam method	Group contribution	Documentation / Presentation
	Permitted resources	Presentation software, report, spreadsheet or Matlab /Simulink/HOMER files allowed as result.	
	Number of examiners	2	
	Assessment	Pass	Mark
	Pass mark	Pass	55
	Minimal result	Pass	55
	Weight	0	1
	Reassessment	1, week 4.11/4.12	
	Compensation	No

Sustainable Energy Systems: Project Documentation and Presentation

Evaluation and Awarding Marks

Name, first name……

Student number…….

	Mark	Motivation	Weight factor
Applying knowledge and understanding C1: Analyzing and defining problems C2: Design C3: Testing C5: Conducting Research Does the candidate show sufficient familiarity with current knowledge? Have the central questions been answered? Are the methods and techniques properly used? Does the student show sufficient analytical skills to master the problem at hand?			1
Making judgments C1: Analyzing and defining problems C2: Design C3: Testing C5: Conducting Research Has critical appraisal been successfully incorporated? Is the student able to correctly interpret and evaluate the quality?			1
Communication C4: Managing work processes C6: Communication and Collaboration Is the student able to present the results to a problem owner? Is the student able to work in a project team? Is the text clearly understandable and in grammatically sound language? Have the formal requirements for literary sources been met?			1
Learning Skills C7: Professional development Does the student display discernible eagerness to tackle the task? Is the problem owner involved adequately? Does the student show problem solving skills? Is the student self-reliant? Does the student reflect on the choices?			1
Final Mark (group) **For a pass all marks should be sufficient**			

Date : Signature examiner , Signature examiner

Module **M SFEE**	**Sustainable Fuel, Engines and Emissions**
Degree program	Master Engineering Systems
Target Group	Elective module
Coordinating lecturer	Adam Daya
Professional Task	Understand, analyze and contribute to technical and societal aspects of sustainable fuels, engines and emissions, and their interactions.
Professional Products	Project plan (project) Report (project and capita selecta) Presentation (progress and final) Test plan and test report (project) if appropriate
Credits / Study load	15 EC / 420 hours
Relationship with and entry requirements concerning examinations	Module Systems Modelling Preferred: basic knowledge of ICE/thermodynamics
General Description	In this module the student will gain knowledge on analyzing combustion engines and fuels, concerning: emissions, performance, fuel consumption, environmental sustainability, chain sustainability, efficiency, (costs) or any other relevant aspect. Theory In the theory part the student will gain knowledge of physics required for analyzing combustion engines. The principal functioning of the engine and its subsystems will be studied. Modelling of engines will be done by using white box modelling. Furthermore attention will be paid to the relation between engine behavior and fuel properties, which ties in to the theme of sustainability where alternative/renewable fuels are investigated. Relevant control methods will be covered and the influence of software calibration on the engine behavior will be studied. Applying in project The theory learned will be implemented in a project. Modelling will be done at the appropriate level of detail. For validation experimental data can be used. Depending on the chosen project application or calibration will be done at an engine testbed or HIL/MIL/SIL setup. Project results and conclusions will be presented in a report and explained orally.
Final Qualifications	C1 Analyzing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration C7 Professional development
Units of study	Sustainable Fuel, Engines and Emissions Theory (7.5 EC) Sustainable Fuel, Engines and Emissions Capita Selecta (2.5 EC) Sustainable Fuel, Engines and Emissions Project (5 EC)

Unit of Study (UoS) **M SFEE T**	**Sustainable Fuel, Engines and Emissions theory**
General Information	
Name of unit of study	Sustainable Fuel and Engines Theory
Code for unit of study	M SFEE T
Teaching Term	Semester 2
Credits/study load	7.5 EC / 210 hours
Study hours (contact hours)	64 contact hours + 6 contact hours exam (written exam WE 1 / 2)
Entry requirements	Systems Modelling
Objectives and instructional formats	
Professional task	Concept design and analysis of engines and fuels
(Professional) products	Not applicable
General description	The course covers the following topics: • The combustion engine as a system • Engine subsystems, components and processes • Modelling of combustion engines • Analyzing different fuels and their effects on the engine, the combustion process • Analyzing the complete chain sustainability of alternative fuels • Control aspects and calibration of combustion engines • Fuel chain sustainability • Environmental sustainability, Well-to-Wheel (WTW) emissions and the impact of CO_2
Compulsory literature	Heywood, Internal Combustion Engines Fundamentals 2E, ISBN 978-1260116106 Lecturing materials and hand-outs on Onderwijs Online
Recommended literature	Ghazi A. Karim, Dual- fuel DIESEL ENGINES (2015) CRC Press
Required software	Matlab, Simulink, GT Power
Relationship	M SFEE CS and M SFEE MP Module: Systems Modelling
Compulsory participation	No, but attendance will be registered

Activities and instructional formats	Lectures, Self-study, Working on (lab)assignments
Examinations	
Final Qualifications	C1 Analyzing and defining problems
Assessment dimensions / learning outcomes	Dimensions of assessment: - Knowledge and understanding (analyzing and defining problems) The student analyzes advanced and innovative configurations of engines and fuels and is able to make conceptual design choices concerning them. The student understands the application of alternative fuels in Internal Combustion Engines, as well as the influence of these fuels on emissions, climate change, and fuel chain sustainability. The student is able to analyze the consequences for performance and emissions and can propose methods for further improvements. (WE1 & WE2) The student analyzes a problem in the field of combustion engines. In doing so, he applies modern Computer Aided Engineering (CAE) tools, also used frequently in the relevant industry and applied research institutes. (M SFEE HTE)
Assessment criteria	The student will be assessed on answering the questions: • clearly and to the point, including sufficient relevant explanation and depth, comparable with the depth of the literature studied • without irrelevant additional information • using correct equations and models for the situation (for example when to use linear or nonlinear models) • using correct units for quantities in equations, graph labels, etc. M SFEE WE1 and WE2: The WarmUp Test result given by the lecturer during the lecturing of the theory determines 20% of the score of the written (re-) exams. There are no separate WarmUp Tests for the re-exams.

Unit of Study (UoS) **M SFEE MP**	**Sustainable Fuel, Engines and Emissions Minor Project**
General Information	
Name of unit of study	Sustainable Fuel, Engines and Emissions Minor Project
Code for unit of study	M SFEE MP
Teaching Term	Semester 2
Credits/study load	5 EC / 140 hours
Study hours (contact hours)	20 contact hours and 4 contact hours presentation
Entry requirements	Systems Modelling
Objectives and instructional formats	
Professional task	Conducting literature research Modelling and validation
(Professional) products	Project plan Report Presentation
General description	• The students have to carry out an assignment, of which model development and analysis as well as experimental validation are essential parts. The Project serves to challenge the students to apply their knowledge and skills on a real-life problem, in correspondence with a subset of the final qualifications and the course discusses the skills needed to perform a research project and includes performing a literature study.
Compulsory literature	-
Recommended literature	• Project Management, A Practical Approach, Roel Grit, Noordhoff Uitgevers, ISBN 9789001790929 • Report Writing for readers with little time, Rien Elling, Bas Andeweg, Noordhoff Uitgevers, ISBN 9789001812591
Software and other materials	Matlab simulink, GT Power
Relationship	M SFEE T and M SFEE CS Module: Systems Modelling
Compulsory participation	yes
Activities and instructional formats	Research Work Forms: Lectures, Assignment
Examinations	
Final Qualifications	C1 Analyzing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research

	C6 Communication and collaboration C7 Professional development
Assessment dimensions / Learning outcomes	Dimensions of assessment - Applying knowledge and understanding (Analyzing and defining problems, Design, Conducting Research) - Making judgements (Analyzing and defining problems, Design, Conducting Research - Communication (managing work processes, communication and collaboration) - Learning skills (professional development) Learning outcomes: The student presents a clear justification of the project approach. The student plans effectively. The student carries out a project based on a real-life problem in which model development and analysis as well as experimental validation are essential parts by applying knowledge and understanding and making judgements based on analysis and validation techniques. The student structures the working process in the engineering domain and is able to effectively communicate the core findings in a structured and convincing way. The student is able to systematically search for information, such as e.g. models, and judge its relevance. The student communicates the project findings in a clear and structured manner with colleague, customers and the wider public in oral and written forms. The content has been reviewed by peers and/or supervisor. The student reflects on his/her role in the project and on his/her professional development. The student is able to analyze a real life problem concerning engines and/or fuels. The student is able to create a model for an engine problem and/or fuel problem and perform a relevant analysis. The student is able to validate modelling results against the real-life situation and problem formulation. The student is able to formulate a proposal for improvement of an engine problem and/or fuel problem and is able to make an assessment of its viability taken into account energy efficiency and environmental sustainability using proper techniques like prototyping, modelling or analysis.
Assessment criteria	The student will be assessed on the criteria mentioned on the evaluation form.

Module **M SI**	**Smart Infrastructure**
Degree program	Master Engineering Systems
Target Group	Elective module
Coordinating lecturer	Frans Tillema
Professional Task	Model and evaluate current mobility challenges to enable suitable advice and strategy.
Professional Products	Design/model of a high level architecture for Smart Infrastructure solution (HTE) Detailed design/model of a technical Smart Infrastructure solution (MP) Intervention and advisory report (MP) Impact assessment report of new technology (CS)
Credits / Study load	15 EC / 420 hours
Relationship with and entry requirements concerning examinations	Entry requirements: Module Systems Modelling Relationship: Module Smart Vehicles
General Description	Smart Infrastructure deals with the **design** and **deployment** of new technological smart infrastructure related solutions to overcome the current negative externalities of traffic and transport i.e. local air pollution, noise pollution, safety hazards, community severance and congestion. The module focuses on the following topics: - History of Intelligent Mobility - Traffic and transport modeling and simulations - Modelling of Smart traffic lights (+control) - Impact and relationship of transport modalities (MAAS) - Architecture of C-ITS solutions - Communication protocols of C-ITS - Data exchange - (Big)Data in traffic and transport - Smart logistics - Governance/Policy of Smart Infrastructure systems - Privacy and Security - Societal impact of Smart Infrastructure solutions - Human behavior with respect to technology - Infrastructure adaptation
Final Qualifications	C1 Analyzing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration C7 Professional development
Units of study	Smart Infrastructure T (7.5 EC) Smart Infrastructure CS (2.5 EC) Smart Infrastructure minor project (5.0 EC)

Unit of Study (UoS) **M SI MP**	**Smart Infrastructure Minor Project**
General Information	
Name of unit of study	Smart Infrastructure Minor Project
Code for unit of study	M SI MP
Teaching Term	Semester 2
Credits/study load	5 EC / 140 hours
Study hours (contact hours)	64 contact hours and 4 contact hours presentation
Entry requirements	Systems Modelling
Objectives and instructional formats	
Professional task	Model and evaluate a new technical smart infrastructure solutions
(Professional) products	Detailed design of a technical Smart Infrastructure solution Policy Intervention advisory report
General description	SI-MP deals with **modelling** and **evaluation** of a new technological smart infrastructure related solution to overcome the current negative externalities of traffic and transport i.e. local air pollution, noise pollution, safety hazards, community severance and congestion. In a practical case, guided by one of the participating governments of private companies, students are stimulated to work together with professionals on a real life smart infrastructure case, e.g.: - Introduction of new C-ITS technology on junctions - Introduction of connected logistics - Introduction of smart vehicles Students ale challenged to model the problem on a functional level, model the technical solution on a functional and profound level and evaluate the impact on negative externalities.
Compulsory literature	Project Management, A Practical Approach, Roel Grit, Noordhoff Uitgevers, ISBN 9789001790929 Report Writing for readers with little time, Rien Elling, Bas Andeweg, Noordhoff Uitgevers, ISBN 9789001812591

Target Group	Elective module
Coordinating lecturer	Ballard Asare-Bediako
Professional Task	Understand, apply and analyze aspects related to power supply and grid stability in a changing energy system, create and evaluate power supply models
Professional Products	Models
Credits / Study load	15 EC / 420 hours
Relationship with and entry requirements concerning examinations	Simultaneously to the Module Systems Modelling or after taking classes Systems Modelling, Sustainable Energy Systems
General Description	In this module the student learns to understand aspects of the energy supply system (generation, transmission and distribution systems), which is changing towards a complex system with centralized and localized sustainable energy production. Students will understand and be able to apply fundamentals of power supply: • Basics of the current energy grid, power supply and assets • Understand consequences of the energy transition for electrical grid stability • Understand the concept of interchangeability of power and heat/gas as energy • Select and apply optimization algorithms for energy management • Model and simulate power control (systems) • Analyze, interpret and mitigate power quality problems • Analyze and design asset management of power system • Apply knowledge to expected and existing energy grid problems
Final Qualifications	C1 Analyzing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration C7 Professional development
Units of study	This module consists of the following units: • Energy Management (2.5 EC) • Power Control (2.5 EC) • Power Quality (2.5 EC) • Asset Management(2.5 EC) • Minor Project (5 EC)

Unit of Study (UoS) **M SPS EM**	**Energy Management**
General Information	
Name of unit of study	Energy Management
Code for unit of study	M SPS EM
Teaching Term	Semester 2
Credits/study load	2.5 EC / 70 hours
Study hours (contact hours)	16 contact hours
Entry requirements	Simultaneously to the Module Sustainable Energy Systems or after taking classes Sustainable Energy Systems, Power Control.
Objectives and instructional formats	
Professional task	Analyze and design optimization algorithm(s) for energy systems in a (micro)grid.
(Professional) products	Various case studies
General description	This course covers the following topics: - Power systems structure (physical, economic and regulatory layers) - Energy optimization: methods, constraints, boundaries, etc. - Economic dispatch and unit commitment application to the power systems. - Smart Grids: Balancing throughout the power system value chain - Grid Evolution & Cyber security.
Compulsory literature	Lecture notes (to be distributed during the lectures) and scientific papers
Recommended literature	*Antonio J. Conejo; Luis Baringo, Power System Operations, Springer, ISBN:978-3-319-69406-1, 978-3-319-69407-8*
Required software	Matlab, Excel, Vision Network Analysis
Relationship	Units of study Smart Power Supply
Compulsory participation	No, but attendance will be registered
Activities and instructional formats	Lectures, (company) guest lectures, self-study and case studies, based on scientific papers.
Examinations	
Final Qualifications	C1 Analyzing and defining problems C2 Design
Assessment dimensions / learning outcomes	Dimensions of assessment: - Knowledge and understanding (Analyzing and defining problems, making judgements) - Applying Knowledge and understanding (design)

	The student explains the different layers of the energy supply systems – physical, economic and regulatory. The student differentiates, tests and implements optimization algorithms for energy management making trade-offs between technical and economic measures and taking into account the regulatory aspects. The student recognizes and describes the Smart Grid concept and is able to design and implement the desired configuration(s) and the control system in a power system value chain.	
Assessment criteria	The student will be assessed on the criteria (questions) mentioned on the evaluation form. (next page)

Smart Power Supply, Energy Management, Evaluation and Awarding Marks
Name, first name and student number ……

	Mark	Motivation	Weight factor
Knowledge and understanding **C1: Analyzing and defining problems** Can the student explain the demand-supply concept in the energy supply system? Can the student analyze if the given set of consumption data and generation units are enough to answer the formulated question? Can the student apply appropriate techno-economic optimization algorithms to match demand and supply?			1
Applying knowledge and understanding **C2 Design** Can the student design a model with available simulation tools for the given question? Can the student design a model and apply appropriate simulation tools, matlab, vision, etc. to solve the given problem? Can the student apply economic dispatch and unit-commitment to find techno-economic optimum for a given demand and supply dataset? Does the student deal with missing or erroneous data correctly?			1
Making judgments **C1: Analyzing and defining problems** Can the student evaluate and compare models and optimization techniques? Can the student motivate the choice of an optimization algorithm? Can the student motivate the assumptions made and explain the results of the model simulations?			1

Unit of Study (UoS) **M SPS PC**	**Power Control (Capita Selecta)**
General Information	
Name of unit of study	Power Control
Code for unit of study	M SPS PC
Teaching Term	Term 3
Credits/study load	2.5 EC / 70 hours
Study hours (contact hours)	16 contact hours
Entry requirements	After taking classes Systems Modelling
Objectives and instructional formats	
Professional task	Create models, perform control and analyze technical performance of a power system
(Professional) products	Various case studies

General description	This course covers the following topics:
	- Introduction to electrical circuits
	  o Use of complex numbers for solving electrical circuits
	  o AC electrical circuits, RMS values and phasors
	  o Resistance, inductance, capacitance. Relationships between currents and voltages for basic circuit elements
	  o Ohm's law, Kirchhoff voltage and current laws
	  o Active and reactive power
	  o Single phase and three phase networks. Electrical circuit analysis as a basis for power system analysis
	- Introduction to power systems
	  o Structure of power systems, grid buildup and hierarchy
	  o Transient phenomena and time scales
	  o Overview of basic power system components and their models
	  o Per unit system and basic power system calculations
	- Steady-state analysis of power systems
	  o Power balance and power flow calculations
	  o Voltage magnitude and angle, relation to active and reactive power flows
	- Synchronous generators
	  o Principle of work
	  o Introduction to synchronous generator control and different control modes
	  o Generator capability limits and PQ-curves
	  o Use of synchronous generators at biomass power plants
	- Inverter-based generators
	  o Introduction to inverters and their controls
	  o Photovoltaic (PV) panels and solar parks
	  o Wind turbines, their types and control
	- Principles of power system control
	  o Voltage and frequency control
	  o Network-connected and island operation modes

Compulsory literature	To be announced	
Recommended literature	To be announced	
Software and other materials	MATLAB, Vision Network Analysis	
Relationship	Units of study Smart Power Supply	
Compulsory participation	No, but attendance will be registered	
Activities and instructional formats	Lectures, (company) guest lectures, self-study and case studies based on scientific papers.	
Examinations		
Final Qualifications	C1 Analyzing and defining problems C2 System Design	
Assessment dimensions / Learning outcomes	Dimensions of assessment: Knowledge and understanding (analyzing the problem) Applying knowledge and understanding (Design) Making judgements (analyzing the problem) The student is able to construct a model of a power system. The student can solve power balance problems and perform technical analysis of a power system performance. The student understands and is able to explain principles used for power system control.	
Assessment criteria	The student will be assesses on the criteria (questions) on the evaluation form (next page).

Unit of Study (UoS) **M SPS PQ**	**Power Quality**
General Information	
Name of unit of study	Power Quality
Code for unit of study	M SPS PQ
Teaching Term	Term 4
Credits/study load	2.5 EC / 70 hours
Study hours (contact hours)	16 contact hours + 3 contact hours exam
Entry requirements	Simultaneously to the Module Systems Modelling or after taking classes Systems Modelling, Power Control, Sustainable Energy Systems
Objectives and instructional formats	
Professional task	Analyze, evaluate and develop solutions for power quality problems.
(Professional) products	Various case studies
General description	This unit deals with the quality of the public electricity grid and electrical installations in general. The use of nonlinear loads and sensitive electronic equipment in the industry, commercial sectors and the domestic environments increased considerably over the last decades. Unfortunately, the same type of equipment often generates disturbances in the energy supply, which in turn affect other devices negatively and give rise to poor power quality. Both theoretical and practical aspects are discussed: • What is power quality and why it is important; • Cost of power quality; • Review of electrical circuits and quantities; • Power quality phenomena (dips, transients, harmonics, flicker); • Fourier theory; • Efficiency and power factor; • Asymmetry and unbalance; • Norms; • Monitoring and analysis; • Power conditioning.
Compulsory literature	Lecture notes (to be distributed during the lectures) and relevant scientific papers
Recommended literature	To be announced
Software and other materials	Matlab, Excel and Power Quality Teaching Tools by PSL. Freely available at http://www.powerstandards.com
Relationship	Units of study Smart Power Supply

Compulsory participation	No, but attendance will be registered	
Activities and instructional formats	Lectures, (company) guest lectures, self-study and case studies.	
Examinations		
Final Qualifications	C1 Analyzing and defining problems C2 System Design	
Assessment dimensions / learning outcomes	Dimensions of assessment: - Applying knowledge and understanding (System Design) - Making judgements (Analyzing and defining problems) The student is able to understand the various aspects of power quality. The student applies the obtained knowledge and skills to a real life power quality problem. The student is able to analyze power quality problems and develop solutions.	
Assessment criteria	The student will be assessed on answering the questions: • clearly and to the point, including sufficient relevant explanation and depth, comparable with the depth of the literature studied • without irrelevant additional information • using correct equations, models and graphs, including labels and units, for the situation (for example when to use linear or nonlinear models)	
Information for each exam and modular exam

Unit of Study (UoS) **M SPS AM**	**Asset Management**
General Information	
Name of unit of study	Asset Management
Code for unit of study	M SPS AM
Teaching Term	Term 3
Credits/study load	2.5 EC / 70 hours
Study hours (contact hours)	16 contact hours and 3 contact hours exam
Entry requirements	Simultaneously to the Module Systems Modelling or after taking classes Systems Modelling
Objectives and instructional formats	
Professional task	Analyze and design asset management of power system
(Professional) products	Various case studies
General description	This course covers the following topics: - Asset management - why? Philosophies and organization o The created value of energy systems o AM purpose and approach o AM standards and organization - Materials for grid components and ageing mechanisms o Components in the grid o Conductors and semi-conductors o Insulators and field-control o Ageing mechanisms and failure o Material and forensic investigations - Maintenance and Incident management o Maintenance concepts o Incidents and emergencies o Descriptive statistic o Inferences: predicting future reliability and failures o Uncertainty and confidence
Compulsory literature	• R. Ross, Reliability Analysis for Asset Management of Electric Power Grids, John Wiley, (eBook: ISBN: 978-1-119-12519-8; hard copy: ISBN: 978-1-119-12517-4) • reader Material analysis (free pdf)
Recommended literature	IAM: Asset Management – an anatomy
Software and other materials	Matlab, Excel, Vision Network Analysis
Relationship	Units of study Smart Power Supply
Compulsory participation	No, but attendance will be registered
Activities and instructional formats	Lectures, (company) guest lectures, self-study and case studies.
Examinations	

Final Qualifications	C1 Analyzing and defining problems C2 Design	
Assessment dimensions / Learning outcomes	Dimensions of assessment: - Applying knowledge and understanding (analyzing and Design systems) The student is able to apply Asset Management methodology to power grids. The student is able to evaluate the suitability of materials and investigate aspects related to failure research and forensic studies. The student is able to judge and formulate maintenance concepts. The student is able to formulate confidence boundaries and significance.	
Assessment criteria	The student will be assessed on answering the questions: • clearly and to the point, including sufficient relevant explanation and depth, comparable with the depth of the literature studied • without irrelevant additional information • using correct equations, models and graphs, including labels and units, for the situation (for example when to use linear or nonlinear models)

Unit of Study (UoS) **M SPS MP**	**Smart Power Supply Minor Project**
General Information	
Name of unit of study	Smart Power Supply Minor Project
Code for unit of study	M SPS MP
Teaching Term	Semester 2
Credits/study load	5 EC / 140 hours
Study hours (contact hours)	28 contact hours and 4 contact hours presentation
Entry requirements	Simultaneously to the Module Systems Modelling or after taking classes Systems Modelling
Objectives and instructional formats	
Professional task	Create models of a selected problem related to expected changes from the energy transition onto the energy grid
(Professional) products	A project report on the modelling of the selected problem including a detailed analysis of the obtained results from simulations using the model.
General description	The Project serves to challenge the students to apply their The project serves to challenge the students to apply their knowledge and skills on an expected or existing real-life problem, in correspondence with a subset of the final qualifications The project covers the following topics: • The problem to be solved requires an understanding and active analysis of distinctive disciplines. • The project will always include the step from a real-life problem to a more abstract representation of the problem in order to be able to create a model • The project also asks to simulate different conditions and/or options using the model, and to translate the results back to the real-life situation. Required results are described under the professional product section. The problem analysis will result in a problem solution to be translated in such terms that conclusions can be drawn based on the extent the problem has been solved and objectives fulfilled.
Compulsory literature	Project Management, A Practical Approach, Roel Grit, Noordhoff Uitgevers, ISBN 9789001790929 Report Writing for readers with little time, Rien Elling, Bas Andeweg, Noordhoff Uitgevers, ISBN 9789001812591
Recommended literature	-
Software and other materials	-

Relationship	Units of study Smart Power Supply
Compulsory participation	yes
Activities and instructional formats	Research Work Forms: Lectures, Assignment Development and analysis of an energy grid related problem by working in a team on a problem.
Examinations	
Final Qualifications	C1 Analyzing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration C7 Professional development
Assessment dimensions / learning outcomes	Dimensions of assessment: - Applying knowledge and understanding (analyzing and defining problems, design, testing, conducting research) - Making judgements (conducting research) - Communication (managing work processes, communication and collaboration) - Learning skills (professional development) Learning outcomes: The student presents a clear justification of the project approach. The student plans effectively. The student carries out a project based on a real-life problem in which model development and analysis as well as experimental validation are essential parts by applying knowledge and understanding and making judgements based on analysis and validation techniques. The student structures the working process in the engineering domain and is able to effectively communicate the core findings in a structured and convincing way. The student is able to systematically search for information, such as e.g. models, and judge its relevance. The student communicates the project findings in a clear and structured manner with colleague, customers and the wider public in oral and written forms. The content has been reviewed by peers and/or supervisor. The student reflects on his/her role in the project and on his/her professional development. The student is able to analyze real life problems concerning effects of energy transition on the power systems.

<table>
<tr><td></td><td colspan="3">The student is able to design a power system related model and perform simulations and tests.
The student is able to interpret results from simulations and tests and develop solutions to the problem.</td></tr>
<tr><td>Assessment criteria</td><td colspan="3">The student will be assessed on the criteria mentioned on the evaluation form.

To determine the result of the minor project for each student:

7. A group mark will be defined by the examiners.
8. Peer review: each minor project group evaluates at least twice the contribution of the group members on content and collaboration. if the outcome of the first peer review is negative for the individual student, the student still has the opportunity to improve. If the result is negative again during the second peer review, the student will not receive a pass and therefore no final grade.
9. The individual mark is based on the group mark and the group contribution. The HAN supervisor can make use of the results of the peer review.

Students should be aware of their own functioning within the project group, so should arrange peer feedback within their project group regularly.</td></tr>

Smart Power Supplies: Project Documentation and Presentation, Evaluation and Awarding Marks

Name, first name…….

	Mark	Motivation	Weight factor
Applying knowledge and understanding C1: Analyzing and defining problems C2: Design C3: Testing C5: Conducting Research Does the candidate show sufficient familiarity with current knowledge? Have the central questions been answered? Are the methods and techniques properly used? Does the student show sufficient analytical skills to master the problem at hand?			1
Making judgments C5: Conducting Research Has critical appraisal been successfully incorporated? Is the student able to correctly interpret and evaluate the quality?			1
Communication C4: Managing work processes C6: Communication and Collaboration Is the student able to present the results to a problem owner? Is the student able to work in a project team? Is the text clearly understandable and in grammatically sound language? Have the formal requirements for literary sources been met?			1
Learning Skills C7: Professional development Does the student display discernible eagerness to tackle the task? Is the problem owner involved adequately? Does the student show problem solving skills? Is the student self-reliant? Does the student reflect on the choices?			1
Final Mark (group) **For a pass all marks should be sufficient**

Module **M SV**	**Smart Vehicles**
Degree program	Master Engineering Systems
Target Group	Elective module
Coordinating lecturer	Chris Huijboom
Professional Task	Assess, design and implement new technologies for connected and automated transport, in the car, bus, bike and other transport modes.
Professional Products	Design/model of a high-level architecture for smart vehicles and other transport modes Detailed design/model of a technical smart vehicle solution Detailed implementation plans and deployment strategy plan Impact assessment report of new technology
Credits / Study load	15 EC / 420 hours
Relationship with and entry requirements concerning examinations	Entry requirements: Module Systems Modelling Relationship: Module Smart Infrastructure
General Description	Smart Vehicles deals with (1) the design and implementation of new technologies for connected and automated transport, in the car, bus, bike and other transport modes and (2) assessing the implementation of such technologies, keeping in mind their various capabilities, vehicle types, performance, functional design, security and privacy concerns, as well as the interplay between the vehicle and its human users The module focuses on the following topics: **Vehicle Technology:** Sensor Technologies and their Environmental Perception, Vehicle Automation (incl. ADAS) & Integration and Embedding of smart vehicle concepts. **Talking Traffic:** IoT, Talking Traffic, 4G 5G G5 WIFI P, Augmented/ Virtual Reality **AI and Deep learning:** Machine learning, A.I. and Deep Learning **Societal and Behavioural Impact:** Human environmental Perception and Interpretation, Human Behaviour, Human Machine Interface, Machine Behaviour, Psychology and Ethics **Governance and Procurement:** Functional Safety, Legal Aspects, Cybersecurity and Privacy Concerns
Final Qualifications	C1 Analysing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration C7 Professional development

Unit of Study (UoS) **M SV CS**	**Smart Vehicles CS**
General Information	
Name of unit of study	Smart Vehicles CS
Code for unit of study	M SV CS
Teaching Term	Semester 1 / Semester 2
Credits/study load	2.5 EC / 70 hours
Study hours (contact hours)	20 contact hours
Entry requirements	Systems Modelling
Objectives and instructional formats	
Professional task	Analyse current state of the art with respect to: • Connectivity standards • Technology • Security • Privacy • Impact & perspective (impact it may have on behaviour aspects)
(Professional) products	Literature review report
General description	The students will deepen the theory of Smart Vehicles and extend their knowledge with relevant, actual topics by conducting a literature review based on scientific paper.
Compulsory literature	-
Recommended literature	-
Software and other materials	-
Relationship	Units of study Smart Vehicles
Compulsory participation	Yes
Activities and instructional formats	Self-study, case studies Work forms: Lectures, interactive exercises, reporting
Examinations	
Final Qualifications	C2 Design C5 Conducting Research

Assessment dimensions / learning outcomes	Dimensions of assessment: • Applying knowledge and understanding (Conducting research) • Making judgements (Design) The student evaluates smart vehicle technologies and writes a literature review article/report about developments in smart vehicle technology. The report has an introduction, a main text, a conclusion, a discussion and references. The student specifies references according to a reference manual. The student determines the validity of referenced resources.	
Assessment criteria	The student will be assessed on the criteria (questions) mentioned on the evaluation form (next page). Furthermore, the paper will primarily be assessed on its: • Clarity, for teaching staff as well as for other classmates • Depth, showing and illustrating the complexity of the topic • Critical thinking, showing and illustrating the student's critical view on the reviewed papers

Study hours (contact hours)	64 contact hours and 4 contact hours presentation
Entry requirements	Systems Modelling
Objectives and instructional formats	
Professional task	Design, Implement, Test & Demonstrate a Smart Vehicle solution in the vehicle's ecosystem while working in the context of a project team.
(Professional) products	Detailed design/model of a technical smart vehicle solution Detailed implementation plans and deployment strategy plan Impact assessment report of new technology Report & Presentation + Demonstration of solution
General description	SVMP deals with (1) the design and implementation of new technologies for connected and automated transport, in the car, bus, bike and other transport modes and (2) assessing the implementation of such technologies, keeping in mind their various capabilities, vehicle types, performance, functional design, security and privacy concerns, as well as the interplay between the vehicle and its human users In a practical case, given by one of the participating governments of private companies, students are stimulated to work together on a real-life smart vehicle case, e.g.: • Introduction of new sensors on cars and buses • Introduction of automated logistics • Introduction of AI and deep learning technologies • Introduction of retro-fit ADAS on existing cars Students are challenged to model the problem on a functional level, model the technical solution on a functional and profound level and evaluate the impact on human behaviour, people, impact, security, privacy and functional design.
Compulsory literature	-
Recommended literature	Project Management, A Practical Approach, Roel Grit, Noordhoff Uitgevers, ISBN 9789001790929 Report Writing for readers with little time, Rien Elling, Bas Andeweg, Noordhoff Uitgevers, ISBN 9789001812591

Software and other materials	MATLAB Simulink, Phyton, Olimexino, Jetson and other materials that may be relevant for the project
Relationship	Units of study Smart Vehicles Units of study Systems Modelling
Compulsory participation	Yes
Activities and instructional formats	Research Work Forms: monitored group work, assignment
Examinations	
Final Qualifications	C1 Analysing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration C7 Professional development
Assessment dimensions / learning outcomes	Dimensions of assessment: • Applying knowledge and understanding (analysing and defining problems, design, testing, conducting research) • Making judgements (analysing and defining problems, design, conducting research) • Communication (managing work processes, collaboration and communication) • Learning skills (professional development) Learning outcomes: The student presents a clear justification of the project approach. The student plans effectively. The student carries out a project based on a real-life problem in which model development and analysis as well as experimental validation are essential parts by applying knowledge and understanding and making judgements based on analysis and validation techniques. The student structures the working process in the engineering domain and is able to effectively communicate the core findings in a structured and convincing way. The student is able to systematically search for information, such as e.g. models, and judge its relevance. The student communicates the project findings in a clear and structured manner with colleague, customers and the wider public in oral and written forms. The content has been reviewed by peers and/or supervisor. The student reflects on his/her role in the project and on his/her professional development. The student designs and implements future smart vehicle technology.

<table>
<tr><td>Assessment criteria</td><td colspan="5">The student will be assessed on the criteria mentioned on the evaluation form.

To determine the result of the minor project for each student:

10. A group mark will be defined by the examiners.
11. Peer review: each minor project group evaluates at least twice the contribution of the group members on content and collaboration. if the outcome of the first peer review is negative for the individual student, the student still has the opportunity to improve. If the result is negative again during the second peer review, the student will not receive a pass and therefore no final grade.
12. The individual mark is based on the group mark and the group contribution. The HAN supervisor can make use of the results of the peer review.

Students should be aware of their own functioning within the project group, so should arrange peer feedback within their project group regularly.</td></tr>

Project Smart Vehicles: Project Documentation and Presentation
Evaluation and Awarding Marks

Name, first name……
Student number……

	Mark	Motivation	Weight factor
Applying knowledge and understanding C1: Analysing and defining problems C2: Design C3: Testing C5: Conducting Research Does the candidate show sufficient familiarity with current knowledge? Have the central questions been answered? Are the methods and techniques properly used? Does the student show sufficient analytical skills to master the problem at hand?			1
Making judgments C1: Analysing and defining problems C2: Design C3: Testing C5: Conducting Research Has critical appraisal been successfully incorporated? Is the student able to correctly interpret and evaluate the quality?			1
Communication C4: Managing work processes C6: Communication and Collaboration Is the student able to present the results to a problem owner? Is the student able to work in a project team? Is the text clearly understandable and in grammatically sound language? Have the formal requirements for literary sources been met?			1
Learning Skills C7: Professional development Does the student display discernible eagerness to tackle the task? Is the problem owner involved adequately? Does the student show problem solving skills? Is the student self-reliant? Does the student reflect on the choices?			1
Final Mark (group) **For a pass all marks should be sufficient**			

Date : Signature examiner: Signature examiner:

4 Major Project

Module code **M MAJP**	**Major Project**
Degree program	Master Engineering Systems
Target Group	All students, mandatory
Coordinating lecturer	Content: Major Project Board Organization / procedures: Kea Bouwman
Professional Task	Not applicable
Professional Products	Project plan (project) Report/article and documentation (project) Presentation (progress and final)
Credits / Study load	30 EC / 840 hours
Relationship with and entry requirements concerning examinations	Unit of study: Major Project: Relationship: all modules Entry requirements: all requirements from the theoretical phase are met. Unit of study: Managing Work Processes: Relationship: all modules Entry requirements: after taking the first semester classes
General Description	The first part is Managing Work Processes: in this unit of study students are four different subjects distinguished: a. Landscape: This deals largely with strategic issues, business trends, product trends and market issues b. Value chain: From sketch till scrap; the total value chain. Product lifecycle management. The production & supply chain and logistics principles. c. Working processes: Organization models. Simultaneous engineering. Lean production. Factory control, management theories. d. Quality models, tools and techniques: General Quality models as EFQM,ISO,TS, DFSS. Quality tools in the design process, and in the production process. The Toyota model (culture) The second part is the major project – the graduation project – itself: this master graduation project is motivated by a real-life problem, supplied by an engineering company. For a detailed description and the procedure see the Manual Major Project published on Onderwijs Online.
Final Qualifications	C1 Analyzing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration C7 Professional development
Units of study	Managing Work processes (2 EC) Major Project (28 EC)

Unit of Study (UoS) **M MAJP MWP**	**Managing Work Processes**
General Information	
Name of unit of study	Managing Work Processes
Code for unit of study	M MAJP MWP
Teaching Term	First en second semester
Credits/study load	2 EC / 56 h.
Study hours (contact hours)	36 contact hours and 4 hours presentation/defense
Entry requirements	After taking the first semester classes
Objectives and instructional formats	
Professional task	Not applicable
(Professional) products	Not applicable
General description	Four different modules are distinguished: e. Landscape: This deals largely with strategic issues, business trends, product trends and market issues f. Value chain: From sketch till scrap; the total value chain. Product lifecycle management. The production & supply chain and logistics principles. g. Working processes: Organization models. Simultaneous engineering. Lean production. Factory control, management theories. h. Quality models, tools and techniques: General Quality models as EFQM,ISO,TS, DFSS. Quality tools in the design process, and in the production process. The Toyota model (culture)

Unit of Study (UoS) **M MAJP MP**	**Major Project**
General Information	
Name of unit of study	Major Project
Code for unit of study	M MAJP MP
Teaching Term	Semester 1 / Semester 2
Credits/study load	28 EC / 784 h.
Study hours (contact hours)	-
Entry requirements	All requirements from the theoretical phase are met. Entry requirements oral defense: theoretical phase and all other fulfilments of the module major project.
Objectives and instructional formats	
Professional task	Not applicable depending on the subject
(Professional) products	proposal project plan, including requirements analysis report/article and documentation
General description	Graduation projects are motivated by real-life problems, supplied by engineering companies. A problem analysis will result in a problem solution, to be translated in terms such that conclusions can be drawn to what extent the problem has been solved and objectives fulfilled. A representative of a company is involved, to verify (1) whether the thesis result match the expectations of the company, and (2) whether the rated aspects of the major project are relevant for the company. In this way, feedback is obtained on the professional requirements regarding the intended learning outcomes. The assignment is carried out by a single student, communicating with an external problem owner. The assignment results are presented and defended in a final presentation, and included in a project report. A detailed description complemented with a procedure can be found in the Manual Major Project Master Engineering Systems (#OO).
Compulsory literature	Lecturing material, papers and hand-outs (Power Point, on Onderwijs Online), Report Writing for readers with little time' van Noordhoff Uitgevers, ISBN 978-90-01-81259-1 Manual Major Project Master Engineering Systems

Examinations	
Final Qualifications	C1 Analyzing and defining problems C2 Design C3 Testing C4 Managing work processes C5 Conducting research C6 Communication and collaboration C7 Professional development
Assessment dimensions / Learning outcomes	Dimensions of assessment: - Knowledge and understanding (C1 Analyzing and defining problems, C5 Conducting Research) - Applying knowledge and understanding (C2 Design, C3 Testing, C4 Managing Work processes) - Making judgements (C1 Analyzing and defining problems, C2 Design, C4 Managing Work processes C5 Conducting Research) - Communication (C1 Analyzing and defining problems, Communication and Collaboration) - Professional Skills (Professional Development) *Analyzing and defining problems:* To be able to critically analyze the engineering problem through active communication with the problem owner, to translate this to a problem formulation, feasible solution approaches and scientifically valid conclusions and recommendations, to be communicated again to the problem owner. *Design:* To be able to systematically translate the engineering problem to a model at an abstract level, (i.e. reducing it to its essentials in terms of model and problem requirements) and to validate results against the real life situation and problem formulation. Testing: To be able to systematically translate the engineering problem to a concrete level, and to validate results against the real life situation and problem formulation. *Managing work processes:* To be able to put engineering activities within the perspective of engineering company processes, including quality control principles. To be able to incorporate the economical (cost) and societal (safety, sustainability) consequences in the design or development process.

	Conducting research: To have gained specialized scientific knowledge and skills in the field of engineering. *Communication and collaboration:* Being able to work on a problem within a multidisciplinary context in an industrial environment. Being able to work on a problem in an international engineering context in an industrial environment *Professional development:* To be able, through self-reflection, to improve one's own professional acting
Assessment criteria	The student will be assessed on the criteria mentioned on the evaluation form. (next page)

Proposal Major Project Technical Masters (including evaluation)

Fill in this form (should fit on 2 pages) and send it to finalthesis.tm@han.nl

General information:

Student name:	
Mobile number:	
Email address:	
Study modules obtained: (for which you obtained 15 EC)	
Study modules currently following:	
Company name:	
Telephone number (company):	
Name of the company supervisor:	
E-mail address (company supervisor)	
Date:	
Major project start	Day – month – year
Date Defense:	Defense in <month>

Major project::

Project title:	
Background Provide a general description of the context of the problem and give the reason for doing this research. Why should the problem be solved?	
Objective: What is the project trying to achieve? Formulate a concise and declarative statement that clarifies which problem should be solved. Note: activities are not objectives!	• …
Activities How are you going to analyze/solve the problem? Sum up the main activities, max. 4.	• … • … •
Deliverables : Sum up the expected final result(s) / deliverables, what will you deliver? Next to your report, this could be one or more models (also state in which form, like Matlab, GTPower, ..), software and/or hardware, manuals, etc.	• Thesis report and presentation • … • …
Demonstrating Master level	
Master level: The main goal of working on a Major Project is to demonstrate your master level. State how you intend to demonstrate your master level. Why do you think this subject can be helpful? Note: do not sum up your study modules here. See the document: *9 tcd_level_ descriptors_full_text_council _8_march_06.pdf*, esp. the introduction and section 3.4	
The proposal is assessed in light of the following consideration: is the student able to show master level with this subject? Confirmation to students by mail / hand in.	Yes/no

Evaluation Project plan

Student name :

The Major Project plan will be judged by the HAN supervisor (after feedback from the company supervisor) on:

	V / NV (= sufficient/ not sufficient)	**Motivation**
Is the project plan structured according to the format given on #OO)?		
Does the text indicate clearly that the research activities will lead methodically to the answering of the main research question?		
Does the text show a methodical approach and are methods and techniques chosen expertly?		
Are the requirements SMART and complete?		
Are the restrictions sufficiently described?		
Are the Activities and Products sufficiently described?		
Are the objectives clear and correct?		
Is the English text understandable and of sufficient level with respect to spelling and grammar?		
Time plan *Present and plausible?*		
V / NV **For a pass all items should be sufficient**	**V / NV**	

Date :

Signature HAN supervisor :

Progress evaluation

Student name :

Student number :

The Major Project progress will be judged by the HAN supervisor on:

	V / NV (= sufficient/ not sufficient)	**Motivation**
Is the major project report structured according to the format given on #OO?		
Does the text show a methodical approach and are methods and techniques chosen expertly?		
Is the table of contents present and sufficiently thought out?		
Chapter 2: Is the study of literature performed adequately and are the references known?		
Chapter 3: Has the student presented a clear justification for his/her approach, based on quantifiable choices?		
Is the English text understandable and of sufficient level with respect to spelling and grammar?		
Are the references correct according to one consistent standard?		
V / NV For a pass all items should be sufficient	V / NV	

Date :

Signature HAN supervisor :

Evaluation Major project report by HAN supervisor and major project board

Student name:
Student number:

Check on plagiarism	Percentage:	
Check pages	Body text > 40 pages	GO / NOGO
Decision GO / NO GO Decision based on check on plagiarism an evaluations of the major project and the HAN supervisor (next pages).	Motivation	

Date :
Name HAN supervisor: *Signature*

Name member major project board: *Signature*

In case you need additional explanation of the given motivation of the marks, contact your examiners.

The Major Project Report will be assessed by the member of the major project board on:

	V / NV (= sufficient/ not sufficient)	Motivation
Knowledge and understanding Has the student demonstrated relevant product knowledge and expertise in the field? Do the student's results show complexity and depth? Have the central questions been answered? C1: Analyzing and defining problems C5: Conducting Research		
Applying knowledge and understanding Are the methods and techniques properly used and described? Do the student's project results demonstrate a structured approach? C2: Design C3: Testing		
Making judgments Does the report incorporate critical appraisal? C1: Analyzing and defining problems C2: Design C5: Conducting Research		
Communication Is the student able to present the content in a convincing way? Does the summary display the process of research and is there a logical consistency between goals and results? Have the formal requirements for diagrams, tables, literary sources etc. been met? C1: Analyzing and defining problems		

The Major Project report/article will be judged by the HAN Supervisor on:

	V / NV (= sufficient/ not sufficient)	Motivation
Knowledge and understanding Are the goals of the report clear? Do the conclusions indicate if the goals are achieved and if not, do they indicate why not?		
Applying knowledge and understanding Are the results obtained in a logical way and are they implementable? Do the recommendations describe their impact on the company?		
Making judgments Has the student presented a clear justification for his/her approach, based on quantifiable choices? Has the student verified the design?		
Communication How is the language; are the texts well formulated? Does the report have a logical structure? Is the relation between goals and results described adequately?		
References Is the study of literature performed adequately and are the references known? and correct according to one consistent standard?		

Major Project : Evaluation and Awarding Marks

Name, first name
Topic
Company
Company representative

Evaluation (for criteria cf. back of this sheet)

The Master thesis / Major Project will be assessed by the examiners assisted by an external expert, the company coach and the main supervisor. The names of the examiners will be made known to the Masters candidate when work on the thesis ends (after the last GO).

	Mark	Motivation
Knowledge and understanding C1: Analyzing and defining problems C5: Conducting Research Weight factor 1, mark ≥ 55		
Applying knowledge and understanding C2: Design C3: Testing C4: Managing work processes Weight factor 1, mark ≥ 55		
Making judgments C1: Analyzing and defining problems C2: Design C4: Managing work processes C5: Conducting Research Weight factor 1, mark ≥ 55		
Communication C1: Analyzing and defining problems C6: Communication and Collaboration Weight factor 1, mark ≥ 55		
Learning Skills C7: Professional development Weight factor 1, mark ≥ 55		
Mark total		

Date :

Signature examiner 2 :

In case you disagree with your mark, first contact your examiner. When you still disagree with your examiner, contact the Exam board of the Master Engineering Systems for a final decision within 7 days.

Masters Degrees

Qualifications which signify the completion of the second cycle (Masters degrees) are awarded to students who have completed a program of study that enables them to show:

DUBLIN DESCRIPTOR	QUALIFICATION
Knowledge and understanding Provides a basis or opportunity for originality in developing or applying ideas often in a research context.	*Analyzing and defining problems:* To be able to critically analyze the engineering problem through active communication with the problem owner, to translate this to a problem formulation, feasible solution approaches and scientifically valid conclusions and recommendations, to be communicated again to the problem owner. *Conducting research:* To have gained specialized scientific knowledge and skills in the field of engineering.
Applying knowledge and understanding Through problem solving abilities applied in new or unfamiliar environments within broader (or multidisciplinary) context.	*Design:* To be able to systematically translate the engineering problem to a model at an abstract level, (i.e. reducing it to its essentials in terms of model and problem requirements) and to validate results against the real life situation and problem formulation. Testing: To be able to systematically translate the engineering problem to a concrete level, and to validate results against the real life situation and problem formulation. *Managing work processes:* To be able to put engineering activities within the perspective of engineering company processes, including quality control principles. To be able to incorporate the economical (cost) and societal (safety, sustainability) consequences in the design or development process.
Making judgements Demonstrates the ability to integrate knowledge and handle complexity, and formulate judgements with incomplete data.	*Conducting research:* To have gained specialized scientific knowledge and skills in the field of engineering. *Analyzing and defining problems:* To be able to critically analyze the engineering problem through active communication with the problem owner, to translate this to a problem formulation, feasible solution approaches and scientifically valid conclusions and recommendations, to be communicated again to the problem owner. *Design:* To be able to systematically translate the engineering problem to a model at an abstract level, (i.e. reducing it to its essentials in terms of model and problem requirements) and to validate results against the real life situation and problem formulation. *Managing work processes:* To be able to put engineering activities within the perspective of engineering company processes, including quality control principles. To be able to incorporate the economical (cost) and societal (safety, sustainability) consequences in the design or development process.
Communication Of their conclusions and underpinning knowledge and rational (restricted scope) to specialist and non-specialist audiences (monologue).	*Analyzing and defining problems:* To be able to critically analyze the engineering problem through active communication with the problem owner, to translate this to a problem formulation, feasible solution approaches and scientifically valid conclusions and recommendations, to be communicated again to the problem owner. *Communication and collaboration:* Being able to work on a problem within a multidisciplinary context in an industrial environment. Being able to work on a problem in an international engineering context in an industrial environment.
Learning skills Study in a manner that may be largely self-directed or autonomous.	*Learning skills:* To be able, through self-reflection, to improve one's own professional acting

GUIDELINES

Criteria

The following questions pertaining to the individual criteria are not final and can vary in importance depending on the type of thesis.

Knowledge and understanding (Dd1)

Provides a basis or opportunity for originality in developing or applying ideas often in a research context.

Criteria to scientific know-how:

- Has the student demonstrated relevant product knowledge and expertise in the field?
- Do the student's results show complexity and depth?
- Has the candidate acquired appropriate knowledge?

Criteria to independent scientific thinking / originality:

- Does the candidate use and develop original ideas?
- Are known ideas interwoven in a new way?
- Are the core findings presented in clear statements?
- Does the thesis incorporate critical appraisal?
- Are the possibilities and limitations of the applied method discussed?

Criteria to logic of the structure, scientific argumentation

- Have the central questions been answered?
- Is a comparison made between the results and published data? Are the results placed in a broader context?
- Are generalizations supported by facts?
- Are the facts clearly distinguishable from hypotheses and suppositions?
- Is the exposition of the topic clear, are the aims logically stated?
- Does the thesis include clearly formulated hypotheses?
- Does the structure of the thesis show a logical approach to the topic?
- Are the results of the research and conclusions clearly and logically presented?

Applying knowledge and understanding (Dd2)

Through problem solving abilities applied in new or unfamiliar environments within broader (or multidisciplinary) context.

Criteria:

- Does the candidate show sufficient familiarity with current knowledge (literature, experiments)?
- Is reference made to gaps in knowledge, based on analyzes of literature?
- Are the methods and techniques properly used and described?
- Are the methods adopted appropriate to the subject matter?
- Has the research (field work, collecting data, experiments, models, etc.) been carried out carefully and adequately?
- International sources of information have been explored appropriately
- The relevant state of art has been discussed adequately, from an international industrial perspective.
- Has the results been sufficiently tested by statistical analyzes?
- Do the student's project results show consideration for stakeholders?
- Do the student's project results demonstrate a structured approach?

Making judgments (Dd3)
Demonstrates the ability to integrate knowledge and handle complexity, and formulate judgements with incomplete data.

Criteria:

- Has the student presented a clear justification for his/her approach, based on quantifiable choices?
- Has the student verified the design?
- Is the student able to correctly interpret and evaluate the quality?
- Are issues mentioned that have not been dealt with?
- Has the research been carried out independently?
- Has critical appraisal been successfully incorporated?

Communication (Dd4)
Of their conclusions and underpinning knowledge and rational (restricted scope) to specialist and non-specialist audiences (monologue).

Criteria:

- Is the student able to operate independently enough in the professional field?
- Is the student able to guide his own work and that of others?
- Does the student work with others in an organization?
- Does the student plan effectively and carry those plans through?
- that they can communicate their conclusions, and knowledge, rationale and processes underpinning these, to specialist and non-specialist audiences clearly and unambiguously

- Is the student able to present the content in a convincing way?
- Does the student get the message across?
- Has the student formulated concrete recommendations based on the results?
- Is the student able to effectively converse with people from other relevant fields?
- Have the formal requirements for diagrams, tables, literary sources etc. been met?
- Is there a comprehensive informative summary?
- Is the text scientifically correct, clearly understandable and in grammatically sound language?
- Is the layout attractive for readers?

Learning Skills (Dd5)
Study in a manner that may be largely self-directed or autonomous.

Criteria:

- Does the candidate display discernible keenness to tackle the task?
- The student has taken a clear responsibility in the project taking initiative in the project finding his way within the company.
- The problem owner (company) has been involved adequately, with feedback actively explored and used in the project.
- Has the student displayed out-of-the-box thinking?
- Is the student able to make the transition to other areas of expertise?
- Does the student reflect on his/her choices, initiatives and judgments?
